You want to have a cost-effective solution. You should also be able to revert back quickly. Which of the below solutions is the most feasible one?**A.** Create a second ELB, and a new Auto Scaling Group assigned a new Launch Configuration. Use Route 53 Weighted Round Robin records to adjust the proportion of traffic hitting the two ELBs**C.** Create a full second stack of instances, cut the DNS over to the new stack of instances, and change the DNS back if a rollback is needed.**D.** Create new AMIs with the new app. Then use the new EC2 instances in half proportion to the older instances.**Answer: A** Explanation: Explanation The Weighted Routing policy of Route53 can be used to direct a proportion of traffic to your application. The best option is to create a second CLB, attach the new Autoscaling Group and then use Route53 to divert the traffic. Option B is wrong because just having EC2 instances running with the new code will not help. Option C is wrong because Elastic beanstalk is good for development environments, and also there is no mention of having 2 environments where environment url's can be swapped. Option D is wrong because you still need Route53 to split the traffic.
