**NEW QUESTION: 1**A solutions architect is implementing a document review application using an Amazon S3 bucket for storage. The solution must prevent accidental deletion of the documents and ensure that all versions of the documents are available. Users must be able to download, modify, and upload documents. Which combination of actions should be taken to meet these requirements? (Select TWO) **A.** Enable MFA Delete on the bucket **B.** Attach an IAM policy to the bucket **C.** Enable versioning on the bucket **D.** Enable a read-only bucket ACL **E.** Encrypt the bucket using AWS KMS **Answer: A,C** **Explanation:** Object Versioning Use Amazon S3 Versioning to keep multiple versions of an object in one bucket. For example, you could store my-image.jpg (version 111111) and my-image.jpg (version 222222) in a single bucket. S3 Versioning protects you from the consequences of unintended overwrites and deletions. You can also use it to archive objects so that you have access to previous versions. To customize your data retention approach and control storage costs, use object versioning with Object lifecycle management. For information about creating S3 Lifecycle policies using the AWS Management Console, see How Do I Create a Lifecycle Policy for an S3 Bucket? in the Amazon Simple Storage Service Console User Guide. If you have an object expiration lifecycle policy in your non-versioned bucket and you want to maintain the same permanent delete behavior when you enable versioning, you must add a noncurrent expiration policy. The noncurrent expiration lifecycle policy will manage the deletes of the noncurrent object versions in the version-enabled bucket. (A version-enabled bucket maintains one current and zero or more noncurrent object versions.) You must explicitly enable S3 Versioning on your bucket. By default, S3 Versioning is disabled. Regardless of whether you have enabled Versioning, each object in your bucket has a version ID. If you have not enabled Versioning, Amazon S3 sets the value of the version ID to null. If S3 Versioning is enabled, Amazon S3 assigns a version ID value for the object. This value distinguishes it from other versions of the same key. Enabling and suspending versioning is done at the bucket level. When you enable versioning on an existing bucket, objects that are already stored in the bucket are unchanged. The version IDs (null), contents, and permissions remain the same. After you enable S3 Versioning for a bucket, each object that is added to the bucket gets a version ID, which distinguishes it from other versions of the same key. Only Amazon S3 generates version IDs, and they can't be edited. Version IDs are Unicode, UTF-8 encoded, URL-ready, opaque strings that are no more than 1,024 bytes long. The following is an example:

3/L4kqtJlcpXroDTDmJ+rmSpXd3dlbrHY+MTRCxf3vjVBH40Nr8X8gdRQBpUMLUo. Using MFA delete if a bucket's versioning configuration is MFA Delete-enabled, the bucket owner must

include the x-amz-mfa request header in requests to permanently delete an object version or change the versioning state of the bucket. Requests that include x-amz-mfa must use HTTPS. The header's value is the concatenation of your authentication device's serial number, a space, and the authentication code displayed on it. If you do not include this request header, the request fails.<https://docs.aws.amazon.com/AmazonS3/latest/dev/ObjectVersioning.html>

**NEW QUESTION: 2** If a Windows host is started for the first time, if the IP address is obtained by DHCP, then what is the source IP address of the first packet sent by this host?  
**A.** 169.254.2.33  
**B.** 0.0.0.0  
**C.** 255.255.255.255

Es gibt zwei Netzwerkadapter. Sie müssen sicherstellen, dass VM1 über NAT eine Verbindung zum Unternehmensnetzwerk herstellt. Lösung: Sie verbinden VM1 mit Internal1. **A.** Ja  
**B.** Nein  
**Answer: A**

**NEW QUESTION: 4** Under which of the following conditions is the supplier most able to influence or control buyers?  
**A.** When the purchasing industry is an important customer to the supplying industry.  
**B.** When the industry is controlled by a large number of companies.  
**C.** When the supplier's products are not differentiated.  
**D.** When the supplier does not face the threat of substitute products.  
**Answer: D**  
Explanation: Choice "b" is correct. When there are few good substitutes for a supplier's product, the supplier has market power (think of a monopoly). As a result, the supplier is better able to control buyers and act as a price setter rather than a price taker. Choice "a" is incorrect. When supplier's products are not differentiated, buyers will be indifferent about which supplier they purchase from. In other words, if firms sell identical products (think of perfect competition) the product of one firm is a perfect substitute for the product of another firm. In this case, firms are price takers, not price setters. Choice "c" is incorrect. When there are a large number of firms, no one firm has much market power. This is the case of either perfect competition (if all firms sell identical products) or monopolistic competition (if all firms sell slightly differentiated products). Choice "d" is incorrect. If the purchasing industry is an important customer of the supplier, the purchasing industry (i.e. the buyer) will have some market power. This will diminish the ability of the supplier to influence or control the buyer.
