NEW QUESTION: 2You are designing a table for a SQL Server database. The table uses horizontal partitioning.You have the following requirements:You need to choose the appropriate data type for the key value.What should you do?**A.** Use the NEWID function to create a unique identifier.**B.** Generate a random value that uses the char(16) data type.**C.** Use the NEWSEQUENTIALID function to create a unique identifier.**D.** Generate a random value that uses the bigint datatype.**Answer: C****Explanation:**Horizontal partitioning divides a table into multiple tables. Each table then contains the same number of columns, but fewer rows. For example, a table that contains 1 billion rows could be partitioned horizontally into 12 tables, with each smaller table representing one month of data for a specific year. Any queries requiring data for a specific month only reference the appropriate table.NEWSEQUENTIALID creates a GUID that is greater than any GUID previously generated by this function on a specified computer since Windows was started. After restartingWindows, the GUID can start again from a lower range, but is still globally unique. When aGUID column is used as a row identifier, using NEWSEQUENTIALID can be faster than using the NEWID function. This is because the NEWID function causes random activity and uses fewer cached data pages. Using NEWSEQUENTIALID also helps to completely fill the data and index pages.
