**NEW QUESTION: 3**Your network contains and Active Directory domain named contoso.com. The domain contains a memberserver named Server1. All servers run Server 2012.You need to collect the error events from all the servers on Server1.The solution ensure that when new servers are added to the domain, their error events are collected automatically on Server1. Which two actions should you perform? (Each correct answer presents part of the solution. Choose two.)**A.** On Server1, create a collector initiated subscription.**B.** From a Group Policy object (GPO), configure the Configure target Subscription Manager settings**C.** From a Group Policy object (GPO), configure the Configure forwarder resource usage settings.**D.** On Server1, create a source computer initiated subscription.**Answer: B,D**Explanation:To set up a Source-Initiated Subscription with Windows Server 2003/2008 so that events of interest from the Security event log of several domain controllers can be forwarded to an administrative workstation Group Policy, The forwarding computer needs to be configured with the address of the server to which the events are forwarded. This can be done with the following group policy

setting: Computer configuration-Administrative templates-Windows components-Event forwarding- Configure the server address, refresh interval, and issue certificate authority of a target subscription manager.\* Edit the GPO and browse to Computer Configuration | Policies | Administrative Templates | Windows Components | Event Forwarding - Configure the server address, refresh interval, and issuer certificate authority of a target Subscription Manager Source-initiated subscriptions allow you to define a subscription on an event collector computer without defining the event source computers, and then multiple remote event source computers can be set up (using a group policy setting) to forward events to the event collector computer. This differs from a collector initiated subscription because in the collector initiated subscription model, the event collector must define all the event sources in the event subscription. When setting up a source-initiated subscription, consider whether the event source computers are in the same domain as the event collector computer. The following sections describe the steps to follow when the event sources are in the same domain or not in the same domain as the event collector computer.Note Any computer in a domain, local or remote, can be an event collector. However, when choosing an event collector, it is important to select a machine that is topologically close to where the majority of the events will be generated. Sending events to a machine at a distant network location on a WAN can reduce overall performance and efficiency in event collection.
