NEW QUESTION: 1A. Option CB. Option AC. Option BD. Option D Answer: D

NEW QUESTION: 2 Ferris Plastics, Inc. is a medium sized company, with an enterprise network (access, distribution and core switches) that provides LAN connectivity from user PCs to corporate servers. The distribution switches are configured to use HSRP to provide a high availability solution.* DSW1 -primary device for VLAN 101 VLAN 102 and VLAN 105* DSW2 - primary device for VLAN 103 and VLAN 104* A failure of GigabitEthernet1/0/1 on primary device should cause the primary device to release its status as the primary device, unless GigabitEthernet1/0/1 on backup device has also failed. Troubleshooting has identified several issues. Currently all interfaces are up. Using the running configurations and show commands, you have been asked to investigate and respond to the following question. During routine maintenance, it became necessary to shut down the GigabitEthernet1/0/1 interface on DSW1. All other interfaces were up. During this time, DSW1 remained the active device for the VLAN 102 HSRP group. You have determined that there is an issue with the decrement value in the track command for the VLAN 102 HSRP group. What needs to be done to make the group function properly?**A.** The decrement value on DSW1 should be greater than 5 and less than 15. **B.** The decrement value on DSW1 should be greater than 190 and less than 200. **C.** The decrement value on DSW1 should be greater than 9 and less than 15. **D.** The decrement value on DSW1 should be greater than 195 and less than 205. **E.** The decrement value on DSW1 should be greater than 11 and less than 19. **Answer: E** Explanation: Explanation The question clearly stated that there was an issue with the decrement value in VLAN 102 so we should check VLAN 102 on both DSW1 and DSW2 switches first. Click on the PC Console1 and PC Console2 to access these switches then use the "show running-config" command on both switches DSW1>enable

DSW1#show running-config DSW2>enable DSW2#show running-configAs shown in the outputs, the DSW1's priority is 200 and is higher than that of DSW2 so DSW1 becomes active switch for the group. Notice that the interface Gig1/0/1 on DSW1 is being tracked so when this interface goes down, HSRP automatically reduces the router's priority by a configurable amount, in this case 5. Therefore the priority of DSW1 goes down from 200 to 195. But this value is still higher than that of DSW2 (190) so DSW1 remains the active switch for the group. To make DSW2 take over this role, we have to configure DSW1's decrement value with a value equal or greater than 11 so that its result is smaller than that of DSW2 ($200 - 11 < 190$). Therefore C is the correct answer.

NEW QUESTION: 3An interface to a library of software functions that provide security and cryptography services is called:
A. An assurance application programming interface (AAPI)
B. A cryptographic application programming interface (CAPI)
C. A confidentiality, integrity and availability application programming interface (CIAAPI)
D. A security application programming interface (SAPI)
Answer: B
Explanation: CAPI is designed for software developers to call functions from the library and, thus, make it easier to implement security services. An example of a CAPI is the Generic Security Service API (GSSAPI.) The GSS-API provides data confidentiality, authentication, and data integrity services and supports the use of both public and secret key mechanisms. The GSS-API is described in the Internet Proposed Standard RFC 2078. The other answers are made-up distracters.

NEW QUESTION: 4You have an Azure subscription named Sub1 that contains an Azure Storage account named Contosostorage1 and an Azure key vault named Contosokeyvault1. You plan to create an Azure Automation runbook that will rotate the keys of Contosostorage1 and store them in Contosokeyvault1. You need to implement prerequisites to ensure that you can implement the runbook. Which three actions should you perform in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.
Answer: Explanation: Explanation
Step 1: Create an Azure Automation account
Runbooks live within the Azure Automation account and can execute PowerShell scripts.
Step 2: Import PowerShell modules to the Azure Automation account
Under 'Assets' from the Azure Automation account Resources section select 'to add in Modules to the runbook. To execute key vault cmdlets in the runbook, we need to add AzureRM.profile and AzureRM.key vault.
Step 3: Create a connection resource in the Azure Automation account
You can use the sample code below, taken from the AzureAutomationTutorialScript example runbook, to authenticate using the Run As account to manage Resource Manager resources with your runbooks. The AzureRunAsConnection is a connection asset automatically created when we created 'run as accounts' above. This can be found under Assets -> Connections. After the authentication code, run the same code above to get all the keys from the vault.
\$connectionName = "AzureRunAsConnection"
try{# Get the connection "AzureRunAsConnection "
\$servicePrincipalConnection=Get-AutomationConnection -Name \$connectionName
"Logging in to Azure..."
Add-AzureRmAccount ` -ServicePrincipal ` -TenantId \$servicePrincipalConnection.TenantId ` -ApplicationId \$servicePrincipalConnection.ApplicationId ` -CertificateThumbprint \$servicePrincipalConnection.CertificateThumbprint
