Answer: Explanation: Explanation Box 1: Read Committed Read Committed: A transaction T1 executing under this isolation level can only access committed data. Pros: Good compromise between concurrency and consistency. Cons: Locking and blocking. The data can change when accessed multiple times within the same transaction. Box 2: Read Uncommitted Read Uncommitted (aka dirty read): A transaction T1 executing under this isolation level can access data changed by concurrent transaction(s). Pros: No read locks needed to read data (i.e. no reader/writer blocking). Note, T1 still takes transaction duration locks for any data modified. Cons: Data is not guaranteed to be transactionally consistent. Box 3: Serializable Serializable: A transaction T1 executing under this isolation level provides the highest data consistency including elimination of phantoms but at the cost of reduced concurrency. It prevents phantoms by taking a range lock or table level lock if range lock can't be acquired (i.e. no index on the predicate column) for the duration of the transaction. Pros: Full data consistency including phantom protection. Cons: Locking and blocking. The S locks are held for the duration of the transaction that can lower the concurrency. References:
