The WatchService API takes advantage of this support where available. However, when a file system does not support this mechanism, the WatchService will poll the file system, waiting for events.Note:WatchKey : When a Watchable entity is registered with a WatchService a key which is a WatchKey is generated. Initially the key is in ready state waiting to be notified of any events on the Watchable entity. Once an event occurs the key goes into signaled state and allows to access the events using its pollEvents method.After processing the poll events the key has to be reset by invoking its reset method.Reference: The Java Tutorials,Watching a Directory for Changes
