**NEW QUESTION: 1**What are two benefit of virtualizing the server with the use of VMs in data center environment?(Choose two.)**A.** speedy deployment**B.** smaller Layer 2 domain**C.** Increased security**D.** reduced IP and MAC address requirements**E.** reduced rack space, power, and cooling requirements**Answer: A, E****Explanation:**Server virtualization and the use of virtual machines is profoundly changing data center dynamics. Most organizations are struggling with the cost and complexity of hosting multiple physical servers in their data centers. The expansion of the data center, a result of both scale-out server architectures and traditional "one application, one server" sprawl, has created problems in housing, powering, and cooling large numbers of underutilized servers. In addition, IT organizations continue to deal with the traditional cost and operational challenges of matching server resources to organizational needs that seem fickle and ever changing. Virtual machines can significantly mitigate many of these challenges by enabling multiple application and operating system environments to be hosted on a single physical server while maintaining complete isolation between the guest operating systems and their respective applications. Hence, server virtualization facilitates server consolidation by enabling organizations to exchange a number of underutilized servers for a single highly utilized server running multiple virtual machines. By consolidating multiple physical servers, organizations can gain several benefits: + Underutilized servers can be retired or redeployed. + Rack space can be reclaimed. + Power and cooling loads can be reduced. + New virtual servers can be rapidly deployed. + CapEx (higher utilization means fewer servers need to be purchased) and OpEx (few servers means a simpler environment and lower maintenance costs) can be reduced.
