NEW QUESTION: 3You have a strict-high queue configured. You notice that under bursty traffic conditions, there are tail drops on the strict-high queue.Which action would solve this problem?**A.** Increase the buffer size of the strict-high queue.**B.** Decrease the buffer size of the strict-high queue.**C.** Assign a policer on egress to assign a low packet loss priority to the strict-high queue.**D.** Assign a policer on ingress to assign a low packet loss priority to the strict-high queue.**Answer: A**Explanation:Explanation/Reference:A queue with strict-high priority is assured unlimited transmission bandwidth but is not actually assigned a large delay buffer. Not configuring a transmit-rate or an explicit buffer-size on a strict-high priority queue only ensures that the queue gets assigned a default minimum delay buffer, making it possible, under bursty conditions, to see tail-drops on strict-high priority queues. Assigning a small transmit-rate or an explicit temporal or percentage buffer-size to the queue ensures that the queue has a large enough buffer to hold bursts and protect against tail-drops.References:
