**NEW QUESTION: 1** Refer to the exhibit. The access layer AOS-Switches currently run DHCP snooping on VLAN 2 and connection rate filtering on edge ports. They are at default settings for ARP protection. A network administrator then enters these commands on each of the access layer switches: Switch(config)# arp-protect vlan 2 Switch(config)# arp-protect Which behavior occurs?  
**A.** The switches will forward legitimate traffic and prevent ARP poisoning attacks, but interfere with connection rate filtering.  
**B.** The switches will not apply ARP protection due to interference from DHCP snooping, so the commands have no effect on current behavior.  
**C.** The switches can now prevent ARP poisoning attacks and do not interfere with legitimate communications.  
**D.** The switches can prevent ARP poisoning attacks, but legitimate communications with VLAN 2 could also be disrupted.  
**Answer: C**

**NEW QUESTION: 2** Which of these statements best describes the major difference between an IPv4-compatible tunnel and a 6to4 tunnel?  
**A.** For an IPv4-compatible tunnel, the ISP assigns only IPv4 addresses for each domain, but for a 6to4 tunnel, the ISP assigns only IPv6 addresses for each domain.  
**B.** An IPv4-compatible tunnel is typically used only between two IPv6 domains, but a 6to4 tunnel is used to connect to connect two or more IPv6 domains.  
**C.** An IPv4-compatible tunnel is a static tunnel, but an 6to4 tunnel is a semiautomatic tunnel.  
**D.** The deployment of a IPv4-compatible tunnel requires a special code on the edge routers, but a 6to4 tunnel does not require any special code.  
**Answer: B**  
Explanation: Automatic 6to4 Tunnels An automatic 6to4 tunnel allows isolated IPv6 domains to be connected over an IPv4 network to remote IPv6 networks. The key difference between automatic 6to4 tunnels and manually configured tunnels is that the tunnel is not point-to-point; it is point-to-multipoint. In automatic 6to4 tunnels, routers are not configured in pairs because they treat the IPv4 infrastructure as a virtual nonbroadcast multi-access (NBMA) link. The IPv4 address embedded

in the IPv6 address is used to find the other end of the automatic tunnel. An automatic 6to4 tunnel may be configured on a border router in an isolated IPv6 network, which creates a tunnel on a per-packet basis to a border router in another IPv6 network over an IPv4 infrastructure. The tunnel destination is determined by the IPv4 address of the border router extracted from the IPv6 address that starts with the prefix 2002::/16, where the format is 2002:border-router-IPv4-address::/48. Following the embedded IPv4 address are 16 bits that can be used to number networks within the site. The border router at each end of a 6to4 tunnel must support both the IPv4 and IPv6 protocol stacks. 6to4 tunnels are configured between border routers or between a border router and a host. The simplest deployment scenario for 6to4 tunnels is to interconnect multiple IPv6 sites, each of which has at least one connection to a shared IPv4 network. This IPv4 network could be the global Internet or a corporate backbone. The key requirement is that each site have a globally unique IPv4 address; the Cisco IOS software uses this address to construct a globally unique 6to4/48 IPv6 prefix. As with other tunnel mechanisms, appropriate entries in a Domain Name System (DNS) that map between hostnames and IP addresses for both IPv4 and IPv6 allow the applications to choose the required address. Automatic IPv4-Compatible IPv6 Tunnels Automatic IPv4-compatible tunnels use IPv4-compatible IPv6 addresses. IPv4-compatible IPv6 addresses are IPv6 unicast addresses that have zeros in the high-order 96 bits of the address, and an IPv4 address in the low-order 32 bits. They can be written as 0:0:0:0:0:0:A.B.C.D or ::A.B.C.D, where "A.B.C.D" represents the embedded IPv4 address. The tunnel destination is automatically determined by the IPv4 address in the low-order 32 bits of IPv4-compatible IPv6 addresses. The host or router at each end of an IPv4-compatible tunnel must support both the IPv4 and IPv6 protocol stacks. IPv4-compatible tunnels can be configured between border-routers or between a border-router and a host. Using IPv4-compatible tunnels is an easy method to create tunnels for IPv6 over IPv4, but the technique does not scale for large networks.

**NEW QUESTION: 3** Lossless Ethernet for FCoE is achieved through the use of which features? (Choose two.)  
**A.** TCP retransmission  
**B.** Ethernet checksum  
**C.** Buffer-to-buffer credits  
**D.** QoS policies  
**E.** Priority flow control  
**Answer: D, E**  
**Explanation:** Lossless behavior on Ethernet is provided by using a priority flow control (PFC) mechanism that prevents packet loss during congestion conditions.

**NEW QUESTION: 4** Which statement about Cisco Discovery Protocol configuration on a Cisco switch is true?  
**A.** CDP is disabled by default and can be enabled globally with the command `cdp run`.  
**B.** CDP is enabled by default and can be disabled globally with the command `no cdp enable`.  
**C.** CDP is enabled by default and can be disabled globally with the command `no cdp run`.  
**D.** CDP is disabled by default and can be enabled globally with the command `cdp enable`.  
**Answer: C**
