NEW QUESTION: 1You are designing a real-time processing solution for maintenance work requests that are received via email.The solution will perform the following actions:* Store all email messages in an archive.* Access weather forecast data by using the Python SDK for Azure Open Datasets.* Identify high priority requests that will be affected by poor weather conditions and store the requests in an Azure SQL database.The solution must minimize costs.How should you complete the solution? To answer, drag the appropriate services to the correct locations. Each service may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.NOTE: Each correct selection is worth one point.

Answer: Explanation:ExplanationBox 1: Azure StorageAzure Event Hubs enables you to automatically capture the streaming data in Event Hubs in an Azure Blob storage or Azure Data Lake Storage Gen 1 or Gen 2 account of your choice, with the added flexibility of specifying a time or size interval. Setting up Capture is fast, there are no administrative costs to run it, and it scales automatically with Event Hubs throughput units. Event Hubs Capture is the easiest way to load streaming data into Azure, and enables you to focus on data processing rather than on data capture.Box 2: Azure Logic AppsYou can monitor and manage events sent to Azure Event Hubs from inside a logic app with the Azure Event Hubs connector. That way, you can create logic apps that automate tasks and workflows for checking, sending, and receiving events from your Event Hub.Reference:
