NEW QUESTION: 1 A 2-day-old infant boy has been diagnosed with an atrial septal defect due to a persistent patent foramen ovale. When explaining the diagnosis to the mother, the nurse includes in the discussion the function of the foramen ovale. In fetal circulation, the foramen ovale allows a portion of the blood to bypass the:
A. Pulmonary system
B. Liver
C. Left ventricle
D. Superior vena cava
Answer: A
Explanation: Explanation (A) The foramen ovale permits a percentage of the blood to shunt from the right atrium to the left atrium. The blood then goes to the left ventricle, permitting systemic fetal circulation with blood containing a higher O₂ saturation. (B) As the blood shunts from the right atrium to the left atrium, the pulmonary system is bypassed. The fetus receives O₂ from the maternal circulation, thereby permitting the partial bypass of the pulmonary system. (C) The foramen ovale is located in the atrial septum of the heart and does not affect the liver. (D) The superior vena cava returns blood to the heart, bringing blood to the location of the foramen ovale.

NEW QUESTION: 2 You have a reporting application that uses a table named Table1. You deploy a new batch update process to perform updates to Table1. The environment is configured with the following properties:
* The database is configured with the default isolation setting.
* The application and process use the default transaction handling.
You observe the application cannot access any rows that are in use by the process. You have the following requirements:
* Ensure the application is not blocked by the process.
* Ensure the application has a consistent view of the data
* Ensure the application does not read dirty data.
You need to resolve the issue and meet the requirements with the least amount of administrative effort. What should you do?
A. Enable the database for the READ_COMMITTED_SNAPSHOT isolation level.
B. Enable the application for the WITH (NOLOCK) hint.
C. Enable the database for the ALLOW_SNAPSHOT_ISOLATION isolation level. Modify the application for the SERIALIZABLE isolation level.
D. Enable the database for the ALLOW_SNAPSHOT_ISOLATION isolation level. Modify the application and the update process for the SNAPSHOT isolation level.
Answer: A
Explanation: Explanation Snapshot isolation must be enabled by setting the ALLOW_SNAPSHOT_ISOLATION ON database option before it is used in transactions. This activates the mechanism for storing row versions in the temporary database (tempdb). READ COMMITTED is the default isolation level for SQL Server. It prevents dirty reads by specifying that statements cannot read data values that have been modified but not yet committed by other transactions. Other transactions can still modify, insert, or delete data between executions of individual statements within the current transaction, resulting in non-repeatable reads, or "phantom" data.

NEW QUESTION: 3 In order to use HAProxy to balance incoming connections to a pool of email servers, which one of the following modes should be used?
A. mode tcp
B. mode email
C. mode mailproxy
D. mode smtp
Answer: A
