**NEW QUESTION: 3**Your network contains two servers named Server1 and Server2. Both servers run Windows Server 2012 R2 and have the DNS Server server role installed. On Server1, you create a standard primary zone named contoso.com. You need to ensure that Server2 can host a secondary zone for contoso.com. What should you do from Server1?**A.** Create a zone delegation that points to Server2.**B.** Create a trust anchor named Server2.**C.** Convert contoso.com to an Active Directory-integrated zone.**D.** Add Server2 as a name server.**Answer: D**  
Explanation:Explanation/Reference:Explanation:Typically, adding a secondary DNS server to a zone involves three steps:On the primary DNS server, add the prospective secondary DNS server to the list of name servers that are authoritative for the zone. On the primary DNS server, verify that the transfer settings for the zone permit the zone to be transferred to the prospective secondary DNS server. On the prospective secondary DNS server, add the zone as a secondary zone. You must add a new Name Server. To add a name server to the list of authoritative servers for the zone, you must specify both the server's IP address and its DNS name. When entering names, click Resolve to resolve the name to its IP address prior to adding it to the list. Secondary zones cannot be AD-integrated under any circumstances. You want to be sure Server2 can host, you do not want to delegate a zone. Secondary Domain Name System (DNS) servers help provide load balancing and fault tolerance. Secondary DNS servers maintain a read-only copy of zone data that is transferred periodically from the primary DNS server for the zone. You can configure DNS clients to query secondary DNS servers instead of (or in addition to) the primary DNS server for a zone, reducing demand on the primary server and ensuring that DNS queries for the zone will be answered even if the primary server is not available.  
How-To: Configure a secondary DNS Server in Windows Server 2012We need to tell our primary DNS that it is ok for this secondary DNS to pull information from it. Otherwise replication will

fail and you will get this big red X. Head over to your primary DNS server, launch DNS manager, expand Forward Lookup Zones, navigate to your primary DNS zone, right-click on it and go to Properties. Go to "Zone Transfers" tab, by default, for security reasons, the "Allow zone transfers: " is unchecked to protect your DNS information. We need to allow zone transfers, if you value your DNS records, you do not want to select "To any server" but make sure you click on "Only to servers listed on the Name Servers tab". Head over to the "Name Servers" tab, click Add. You will get "New Name Server Record" window, type in the name of your secondary DNS server. It is always better to validate by name not IP address to avoid future problems in case your IP addresses change. Once done, click OK. You will see your secondary DNS server is now added to your name servers selection, click OK. Now if you head back to your secondary DNS server and refresh, the big red X will go away and your primary zone data will populate. Your secondary DNS is fully setup now. You cannot make any DNS changes from your secondary DNS. Secondary DNS is a read-only DNS, Any DNS changes have to be done from the primary DNS. **NEW QUESTION: 4** Your network contains an Active Directory domain named contoso.com. Contoso.com contains a member server that runs Windows Server 2008 Standard. You need to install an enterprise subordinate certification authority (CA) that support private key archival. You must achieve this goal by using the minimum amount of administrative effort. What do you do first?  
**A.** Run the Security Configuration Wizard (SCW) and select the Active Directory Certificate Services Certification Authority server role template check box.  
**B.** Initialize the Trusted Platform Module (TPM)  
**C.** Install the Certificate Enrollment Policy Web Service role service on the member server.  
**D.** Upgrade the member server to Windows Server 2008 R2 Standard.  
**Answer: D**  
**Explanation:** Private key archival is a new feature to CA's in Server 2008 R2, so this is why the server needs upgraded. Reference: <http://technet.microsoft.com/en-us/library/cc730721.aspx>  
**WRONG ANSWER** The Certificate Enrollment Policy Web Service is an Active Directory Certificate Services (AD CS) role service that enables users and computers to obtain certificate enrollment policy information. Together with the Certificate Enrollment Web Service, this enables policy-based certificate enrollment when the client computer is not a member of a domain or when a domain member is not connected to the domain.
