NEW QUESTION: 1 Which of the following represents important technical controls for securing a SAN storage infrastructure? (Select TWO).
A. Storage pool space allocation
B. Port mapping
C. Data de-duplication
D. LUN masking/mapping
E. Synchronous copy of data
F. Port scanning
G. RAID configuration
Answer: B, D
Explanation: A logical unit number (LUN) is a unique identifier that designates individual hard disk devices or grouped devices for address by a protocol associated with a SCSI, iSCSI, Fibre Channel (FC) or similar interface. LUNs are central to the management of block storage arrays shared over a storage area network (SAN). LUN masking subdivides access to a given port. Then, even if several LUNs are accessed through the same port, the server masks can be set to limit each server's access to the appropriate LUNs. LUN masking is typically conducted at the host bus adapter (HBA) or switch level. Port mapping is used in 'Zoning'. In storage networking, Fibre Channel zoning is the partitioning of a Fibre Channel fabric into smaller subsets to restrict interference, add security, and to simplify management. While a SAN makes available several devices and/or ports to a single device, each system connected to the SAN should only be allowed access to a controlled subset of these devices/ports. Zoning can be applied to either the switch port a device is connected to OR the WWN World Wide Name on the host being connected. As port based zoning restricts traffic flow based on the specific switch port a device is connected to, if the device is moved, it will lose access. Furthermore, if a different device is connected to the port in question, it will gain access to any resources the previous host had access to.

NEW QUESTION: 2 Which of the following SOM systems is not monitored?
A. Light performance flatness
B. Receive OTU input optical power
C. Main light path performance
D. Type of

Answer: D

NEW QUESTION: 3 You are designing a database named DB1. Changes will be deployed to DB1 every Wednesday night. You need to recommend a strategy to deploy the changes to DB1. The strategy must meet the following requirements: The strategy must not disrupt backup operations. DB1 must be online while the changes are deployed. You must be able to undo quickly any changes made to objects. What should you recommend? More than one answer choice may achieve the goal. Select the BEST answer. ---
A. Create a database snapshot. If the deployment fails, recover the objects from the database snapshot.
B. Perform a full database backup before the changes are deployed. If the deployment fails, restore the database to another server and recover the original objects from the restored database.
C. Create a database snapshot. If the deployment fails, revert the database to the database snapshot.
D. Perform a copy-only database backup before the changes are deployed. If the deployment fails, restore the database to another server and recover the original objects from the restored database.
Answer: C
Explanation: Reference: Database Snapshots (SQL Server)

NEW QUESTION: 4 For what purpose is the Cisco ASA appliance web launch SSL VPN feature used?
A. to optimize the SSL VPN connections using DTLS
B. to enable users to login to a web portal to download and launch the AnyConnect client
C. to enable split tunneling when using clientless SSL VPN access
D. to enable smart tunnel access for applications that are not web-based
E. to enable single-sign-on so the SSL VPN users need only log in once
Answer: B
Explanation:

http://www.cisco.com/en/US/docs/security/vpn_client/anyconnect/anyconnect24/administration/guide/ac01intro.html AnyConnect Standalone and WebLaunch Options
The user can use the AnyConnect Client in the following modes:
Standalone mode - Lets the user establish a Cisco AnyConnect VPN client connection without the need to use a web browser. If you have permanently installed the AnyConnect client on the user's PC, the user can run in standalone mode. In standalone mode, a user opens the AnyConnect client just like any other application and enters the username and password credentials into the fields of the AnyConnect GUI. Depending on how you configure the system, the user might also be required to select a group. When the connection is established, the security appliance checks the version of the client on the user's PC and, if necessary, downloads the latest version.
WebLaunch mode - Lets the user enter the URL of the security appliance in the Address or Location field of a browser using the https protocol. The user then enters the username and password information on a Logon screen and selects the group and clicks submit. If you have specified a banner, that information appears, and the user acknowledges the banner by clicking Continue. The portal window appears. To start the AnyConnect client, the user clicks Start AnyConnect on the main pane. A series of documentary windows appears. When the Connection Established dialog box appears, the connection is working, and the user can proceed with online activities. Whether connecting via standalone mode or WebLaunch mode, the AnyConnect client package must be installed on the security appliance in order for the client to connect. This ensures that the security appliance is the single point of enforcement as to which versions of the client can establish a session, even if you deploy the client with an enterprise software deployment system. When you load a client package on the security appliance, you enforce a policy that only versions as new as the one loaded can connect. AnyConnect users must upgrade their clients by loading the latest version of the client with the latest security features on the security appliance.
