NEW QUESTION: 1You are the Scrum Master for your organization and you are working to create a Development Team. Which one of the following is the best solution to create a Development Team for a new project?**A.** Hire a Scrum Coach to help the developers become self-managing.**B.** You should allow the developers to self-organize into a Development Team.**C.** Have the Development Team work directly the customers of the project.**D.** Recruit people from departments within the organization that can best support the project.**Answer: B**

NEW QUESTION: 2Suspicious traffic without a specific signature was detected. Under further investigation, it was determined that these were false indicators. Which of the following security devices needs to be configured to disable future false alarms?**A.** Signature based ID**S****B.** Anomaly based ID**S****C.** Application based IP**S****D.** Signature based IP**S****Answer: B****Explanation:** Explanation/Reference:Explanation:Most intrusion detection systems (IDS) are what is known as signature-based. This means that they operate in much the same way as a virus scanner, by searching for a known identity - or signature - for each specific intrusion event. And, while signature-based IDS is very efficient at sniffing out known s of attack, it does, like anti-virus software, depend on receiving regular signature updates, to keep in touch with variations in hacker technique. In other words, signature-based IDS is only as good as its database of stored signatures.Any organization wanting to implement a more thorough - and hence safer - solution, should consider what we call anomaly-based IDS. By its nature, anomaly-based IDS is a rather more complex creature. In network traffic terms, it captures all the headers of the IP packets running towards the network. From this, it filters out all known and legal traffic, including web traffic to the organization's web server, mail traffic to and from its mail server, outgoing web traffic from company employees and DNS traffic to and from its DNS server.There are other equally obvious advantages to using anomaly-based IDS. For example, because it detects any traffic that is new or unusual, the anomaly method is particularly good at identifying sweeps and probes towards network hardware. It can, therefore, give early warnings of potential intrusions, because probes and scans are the predecessors of all attacks. And this applies equally to any new service installed on any item of hardware - for example, Telnet deployed on a network router for maintenance purposes and forgotten about when the maintenance was finished. This makes anomaly-based IDS perfect for detecting anything from port anomalies and web anomalies to mis-formed attacks, where the URL is deliberately mis-typed.

NEW QUESTION: 3Which function does a fabric edge node perform in an SD-Access deployment?**A.** Provides reachability border nodes in the fabric underlay**B.** Connects endpoints to the fabric and forwards their traffic**C.** Connects the SD-Access fabric to another fabric or

external Layer 3 networks **D**. Encapsulates end-user data traffic into LISP. **Answer: B**
Explanation: Explanation There are five basic device roles in the fabric overlay:
+ Control plane node: This node contains the settings, protocols, and mapping tables to provide the endpoint-to-location (EID-to-RLOC) mapping system for the fabric overlay.
+ Fabric border node: This fabric device (for example, core layer device) connects external Layer 3 networks to the SDA fabric.
+ Fabric edge node: This fabric device (for example, access or distribution layer device) connects wired endpoints to the SDA fabric.
+ Fabric WLAN controller (WLC): This fabric device connects APs and wireless endpoints to the SDA fabric.
+ Intermediate nodes: These are intermediate routers or extended switches that do not provide any sort of SD-Access fabric role other than underlay services.
