You need to ensure that the `Content` property of the Button control is data-bound to the `DisplayValue` property of the selected item of `lbxItems`. Which binding expression should you use?

B. `{Binding Source=lbxItems, ElementName=SelectedItem, Path=DisplayValue}`

NEW QUESTION: 3The feasible solution region is bounded by the lines connecting points:
A. 3, 5, 6, and 7.
B. 3, 4, 6, and 7.
C. 2, 4, 5, 6, and 8.
D. 1, 5, 6, and 8.
Answer: B Explanation: A model consisting of a system of functions may be used to optimize an objective function. If the

functions in the model are all linear, the model is a linear programming model. Linear programming is a technique to determine optimal resource allocation. Several solution methods are available to solve linear programming problems. The graphical method, the easiest technique, is limited to simple problems. Here, the graph consists of three lines, each representing a production constraint. The lines connecting points 3, 4, 6, and 7 bound the feasible solution region. Product mixes of X and Y that lie outside this boundary cannot be produced and/or sold because the demand constraint (line 3, 4), the labor constraint (line 4, 6), and the material constraint (line 6, 7) are binding.
