NEW QUESTION: 1A company is using AWS CodeDeploy to automate software deployment. The deployment must meet these requirements: *A number of instances must be available to serve traffic during the deployment. Traffic must be balanced across those instances, and the instances must automatically heal in the event of failure. *A new fleet of instances must be launched for deploying a new revision automatically, with no manual provisioning. *Traffic must be rerouted to the new environment to half of the new instances at a time. The deployment should succeed if traffic is rerouted to at least half of the instances; otherwise, it should fail. *Before routing traffic to the new fleet of instances, the temporary files generated during the deployment process must be deleted. *At the end of a successful deployment, the original instances in the deployment group must be deleted immediately to reduce costs. How can a DevOps Engineer meet these requirements? **A.** Use an Application Load Balancer and an in-place deployment. Associate the Auto Scaling group and Application Load Balancer target group with the deployment group. Use the Automatically copy Auto Scaling group option, and use CodeDeployDefault AllatOnce as a deployment configuration. Instruct AWS CodeDeploy to terminate the original instances in the deployment group, and use the BlockTraffic hook within appspec.yml to delete the temporary files. **B.** Use an Application Load Balancer and a blue/green deployment. Use the Automatically copy Auto Scaling group option, and use CodeDeployDefault HalfAtATime as the deployment configuration.
