All traffic that is permitted by the ACL is subject to inspection by the IPS. Traffic that is denied by the ACL is not inspected by the IPS. router(config)# ip ips name ips list ?<1-199> Numbered access list WORD Named access list Step 4.2: Configure IPS signature storage location, this is the directory `ips' created in Step 2 ip ips config location flash:<directory name> router(config)# ip ips config location flash:ips Step 4.3: Enable IPS SDEE event notification ip ips notify sdee router(config)# ip ips notify sdee To use SDEE, the HTTP server must be enabled (via the `ip http server' command). If the HTTP server is not enabled, the router cannot respond to the SDEE clients because it cannot see the requests. SDEE notification is disabled by default and must be explicitly enabled.

**NEW QUESTION: 2** Which Cisco feature can help mitigate spoofing attacks by verifying symmetry of the traffic path? **A. Unidirectional Link Detection B. TrustSec C. Unicast Reverse Path Forwarding D. IP Source Guard** **Answer: C** Explanation: Unicast Reverse Path Forwarding (uRPF) can mitigate spoofed IP packets. When this feature is enabled on an interface, as packets enter that interface the router spends an extra moment considering the source address of the packet. It then considers its own routing table, and if the routing table does not agree that the interface that just received this packet is also the best egress interface to use for forwarding to the source address of the packet, it then denies the packet. This is a good way to limit IP spoofing. Source: Cisco Official Certification Guide, Table 10-4 Protecting the Data Plane, p.270
