NEW QUESTION: 1 귀사에는 런던에 100 개의 클라이언트 컴퓨터가 있는 본사가 있습니다. 3 년 전에 Azure AD (Azure Active Directory)로 마이그레이션했습니다. 회사의 보안 정책에 따르면 모든 개인 장치 및 회사 소유 장치는 Azure AD에 등록되거나 가입되어 있어야 합니다. User1이라는 원격 사용자는 홈 네트워크에서 개인 장치를 Azure AD에 가입시킬 수 없습니다. 다른 사용자가 자신의 장치를 Azure AD에 가입시킬 수 있는지 확인합니다. User1이 장치를 Azure AD에 가입시킬 수 있는지 확인해야 합니다. 어떻게 해야 합니까?**A.** 장치 설정 블레이드에서 사용자가 장치를 Azure AD 설정에 가입시킬 수 있도록 수정합니다.**B.** User1의 홈 네트워크에서 Azure로 직접 간 VPN을 만듭니다.**C.** 장치 설정 블레이드에서 사용자 설정 당 최대 장치 수를 수정하십시오.**D.** User 관리자 역할을 User1에 할당하십시오.**Answer: A****Explanation:** Explanation The Maximum number of devices setting enables you to select the maximum number of devices that a user can have in Azure AD. If a user reaches this quota, they will not be able to add additional devices until one or more of the existing devices are removed.

NEW QUESTION: 2 Sie haben einen Dienst in einem Kubernetes-Cluster bereitgestellt. Eine andere Anwendung muss über die private IP-Adresse des Pods auf den Dienst zugreifen. Welchen der folgenden Typen würden Sie als Netzwerktyp für den Cluster definieren, um diese Anforderung zu erfüllen?**A.** Netzwerksicherheitsgruppen**B.** Service-Endpunkte**C.** Kubenet**D.** Azure-Container-Netzwerk-Plugin**Answer: D****Explanation:** Azure container networking plugin : Correct Choice With the Azure container networking plugin , every pod gets an IP address allocated. With Azure CNI, every pod gets an IP address from the subnet and can be accessed directly. These IP addresses must be unique across your network space, and must be planned in advance. Each node has a configuration parameter for the maximum number of pods that it supports. The equivalent number of IP addresses per node are then reserved up front for that node. This approach requires more planning, as can otherwise lead to IP address exhaustion or the need to rebuild clusters in a larger subnet as your application demands grow. Nodes use the Azure Container Networking Interface (CNI) Kubernetes plugin. Kubenet : Incorrect Choice The kubenet networking option is the default configuration for AKS cluster creation. With kubenet, nodes get an IP address from the Azure virtual network subnet. Pods receive an IP address from a logically different address space to the Azure virtual network subnet of the nodes. Service Endpoints : Incorrect Choice Capabilities like service endpoints or UDRs are supported with both kubenet and Azure CNI, the support policies for AKS define what changes you can make. For example: * If you manually create the virtual network resources for an AKS cluster, you're supported when configuring your own UDRs or service endpoints. * If the Azure platform

automatically creates the virtual network resources for your AKS cluster, it isn't supported to manually change those AKS-managed resources to configure your own UDRs or service endpoints. Network security groups : Incorrect Choice A network security group filters traffic for VMs, such as the AKS nodes. As you create Services, such as a LoadBalancer, the Azure platform automatically configures any network security group rules that are needed.
