**NEW QUESTION: 3**Which TCSEC (Orange Book) level requires the system to clearly identify functions of security administrator to perform security-related functions?**A.** B3**B.** B1**C.** C2**D.** B2**Answer: A****Explanation:**B1: Labeled Security Each data object must contain a classification label and each subject must have a clearance label. When a subject attempts to access an object, the system must compare the subject and object's security labels to ensure the requested actions are acceptable. Data leaving the system must also contain an accurate security label. The security policy is based on an informal statement and the design specifications are reviewed and verified. It is intended for environments that require systems to handle classified data.B2: Structured Protection The security policy is clearly defined and documented, and the system design and implementation are subjected to more thorough review and testing procedures. This class requires more stringent authentication mechanisms and well-defined interfaces among layers. Subjects and devices require labels, and the system must not allow covert channels. A trusted path for logon and authentication processes must be in place, which means

there are no trapdoors. A trusted path means that the subject is communicating directly with the application or operating system. There is no way to circumvent or compromise this communication channel. There is a separation of operator and administration functions within the system to provide more trusted and protected operational functionality. Distinct address spaces must be provided to isolate processes, and a covert channel analysis is conducted. This class adds assurance by adding requirements to the design of the system. The environment that would require B2 systems could process sensitive data that require a higher degree of security. This environment would require systems that are relatively resistant to penetration and compromise. (A trusted path means that the user can be sure that he is talking to a genuine copy of the operating system.)

**B3: Security Domains** In this class, more granularity is provided in each protection mechanism, and the programming code that is not necessary to support the security policy is excluded. The design and implementation should not provide too much complexity because as the complexity of a system increases, the ability of the individuals who need to test, maintain, and configure it reduces; thus, the overall security can be threatened. The reference monitor components must be small enough to test properly and be tamperproof. The security administrator role is clearly defined, and the system must be able to recover from failures without its security level being compromised. When the system starts up and loads its operating system and components, it must be done in an initial secure state to ensure that any weakness of the system cannot be taken advantage of in this slice of time.
