NEW QUESTION: 3Testlet: Northwind TradersYou need to recommend a backup strategy for Hyper-V.What should you recommend?Exhibit:**A.** Take a snapshot of each VM, and then run a full backup of the Hyper-V hosts by using Windows Server Backup.**B.** From each VM, run a full backup by using Windows Server Backup, and then run a full backup of the Hyper-V hosts by using Windows Server Backup.**C.** Shut down the VMs, and then run a full backup of the Hyper-V hosts by using Windows Server Backup. Restart the VMs when the backup is complete.**D.** From each VM, run a full backup by using Windows Server Backup. Shut down the VMs, and then run a full backup of the Hyper-V hosts by using Windows Server Backup. Restart the VMs when the backup is complete.**Answer: B**Explanation:

<http://technet.microsoft.com/en-us/library/dd252619%28WS.10%29.aspx>There are two basic methods you can use to perform a backup. You can:Perform a backup from the server running Hyper-V. We recommend that you use this method to perform a full server backup because it captures more data than the other method. If the backup application is compatible with Hyper-V and the Hyper-V VSS writer, you can perform a full server backup that helps protect all of the data required to fully restore the server, except the virtual networks. The data included in such a backup includes the configuration of virtual machines, snapshots associated with the virtual machines, and virtual hard disks used by the virtual machines. As a result, using this method can make it easier to recover the server if you need to, because you do not have to recreate virtual machines or reinstall Hyper-V. However, virtual networks are not included in a full server backup. You will need to reconfigure the virtual networking by recreating the virtual networks and then reattaching the virtual network adapters in each virtual machine to the appropriate virtual network. As part of your backup planning, make sure you document the configuration and all relevant settings of your virtual network if you want to be able to recreate it.Perform a backup from within the guest operating system of a virtual machine. Use this method when you need to back up data from storage that is not supported by the Hyper-V VSS writer. When you use this method, you run a backup application from the guest operating system of the virtual machine. If you need to use this method, you should use it in addition to a full server backup and not as an alternative to a full server backup. Perform a backup from

within the guest operating system before you perform a full backup of the server running Hyper-V. For more information about storage considerations, see the following section.
