**NEW QUESTION: 1**You need to create a method that can be called by using a varying number of parameters. What should you use?  
**A.** method overloading  
**B.** enumeration  
**C.** derived classes  
**D.** interface  
**Answer: A**  
**Explanation:** Member overloading means creating two or more members on the same type that differ only in the number or type of parameters but have the same name. Overloading is one of the most important techniques for improving usability, productivity, and readability of reusable libraries. Overloading on the number of parameters makes it possible to provide simpler versions of constructors and methods. Overloading on the parameter type makes it possible to use the same member name for members performing identical operations on a selected set of different types.

**NEW QUESTION: 2**  
**A.** Option B  
**B.** Option D  
**C.** Option C  
**D.** Option A  
**Answer: B**

**NEW QUESTION: 3**Scenario Refer to the topology. Your company has decided to connect the main office with three other remote branch offices using point-to-point serial links. You are required to troubleshoot and resolve OSPF neighbor adjacency issues between the main office and the routers located in the remote branch offices. An OSPF neighbor adjacency is not formed between R3 in the main office and R6 in the Branch3 office. What is causing the problem?  
**A.** There is a PPP authentication issue; the username is not configured on R3 and R6.  
**B.** There is an OSPF hello and dead interval mismatch.  
**C.** There is an area ID mismatch.  
**D.** The R3 router ID is configured on R6.  
**Answer: D**  
**Explanation:** Using the show running-config command we see that R6 has been incorrectly configured with the same router ID as R3 under the router OSPF process.

**NEW QUESTION: 4**You are troubleshooting interface net3 and you enter the following sequence of commands: Your next command should be:  
**A.** ipadm create-addr -T static -a 192.168.1.25/24 net3  
**B.** ipadm up-addr net3/v4  
**C.** ipadm create-ip -T static -a 192.168.1.25/24 -n net3  
**D.** ipadm create-vnic -a 192.168.1.25/24 net3/v4  
**E.** ipadm enable-if -T net3  
**Answer: A**  
**Explanation/Reference:** Explanation: If you are assigning a static IP address, use the following syntax: # ipadm create-addr -T static -a address addrobj where addrobj uses the naming format interface/user-defined-string, such as e1000g0/v4globalz. Note: create-addr [-t] -T static [-d] -a {local | remote}=addr[/prefixlen], ... addrobj Creates a static IPv4 or IPv6 address on the interface specified in addrobj. If the interface on which the address is created is not plumbed, this subcommand will implicitly plumb the interface. The created static address will be identified by addrobj. By default, a configured address will be marked up, so that it can be used as a source or destination of or for outbound and inbound packets.
