OSPF runs over IP as protocol number 89. IS-IS runs directly over layer 2 and hence:----cannot support virtual links unless some explicit tunneling is implemented packets are kept small so that they don't require hop-by-hop fragmentation uses ATM/SNAP encapsulation on ATM but there are hacks to make it use VcMux encapsulation some operating systems that support IP networking have been implemented to differentiate Layer 3 packets in kernel. Such OSs require a lot of kernel modifications to support IS-IS for IP routing. can never be routed beyond the immediate next hop and hence shielded from IP spoofing and similar-Denial of Service attacks.
