**NEW QUESTION: 2**You plan to share packages that you wrote, tested, validated, and deployed by using Azure Artifacts.You need to release multiple builds of each package by using a single feed. The solution must limit the release of packages that are in development.What should you use?**A.** global symbols**B.** upstream sources**C.** views**D.** local symbols**Answer: C**Explanation: ExplanationViews enable you to share subsets of the NuGet, npm, Maven, Python and Universal Packages package-versions in your feed with consumers. A common use for views is to share package versions that have been tested, validated, or deployed but hold back packages still under development and packages that didn't meet a quality bar.

**NEW QUESTION: 3**A server with a statically assigned IP address is attached to a switch that is provisioned for DHCP snooping. For more protection against malicious attacks, the network team is considering enabling dynamic ARP inspection alongside DHCP snooping. Which solution ensures that the server maintains network reachability in the future?**A.** Verify the source MAC address of all untrusted interfaces with ip dhcp snooping verify mac-address command.**B.** Configure a static DHCP snooping binding entry on the switch.**C.** Trust the interface that is connected to the server with the ip dhcp snooping trust command.**D.** Disable DHCP snooping information option.**Answer: B**Explanation:Explanation/Reference:Explanation: Dynamic ARP inspection is a security feature that validates ARP packets in a network. It intercepts, logs, and discards ARP packets with invalid IP-to-MAC address bindings. This capability protects the network from certain man-in-the-middle attacks.Dynamic ARP inspection ensures that only valid ARP requests and responses are relayed. The switch performs these activities:Intercepts all ARP requests and responses on untrusted portsVerifies that each of these intercepted packets has a valid IP-to-MAC address binding before updating the local ARP cache or before forwarding the packet to the appropriate destination.Drops invalid ARP packetsDynamic ARP inspection determines the validity of an ARP packet based on valid IP-to-MAC address bindings stored in a trusted database, the DHCP snooping binding database. This database is built by DHCP snooping if DHCP snooping is enabled on the VLANs

and on the switch. If the ARP packet is received on a trusted interface, the switch forwards the packet without any checks. On untrusted interfaces, the switch forwards the packet only if it is valid. To ensure network reachability to the server, configure a static DHCP snooping binding entry on the switch. Reference:
