**NEW QUESTION: 1** On a debian system which of the following would build a boot disk?  
**A.** makeboot --device /dev/fd0 2.4.18-12  
**B.** mkbootdisk /boot/vmlinuz-2.4.18-12  
**C.** mkboot --device /dev/fd0 2.4.18-12  
**D.** mkboot /boot/vmlinuz-2.4.18-12  
**E.** mkboot /dev/floppy  
**Answer: C**  
Explanation: mkboot creates a boot floppy appropriate for the running system. The boot disk is entirely self-contained, and includes an initial ramdisk image which loads any necessary SCSI modules for the system. The created boot disk looks for the root filesystem on the device suggested by /etc/fstab. The only required argument is the kernel version to put onto the boot floppy. Syntax: mkbootdisk [options] kernel version. By default mkboot creates the boot disk on first floppy device. If you want to specify the device use the --device option. In debian you should specify the kernel filename which resides on /boot.
