NEW QUESTION: 1[According to the PRMIA study guide for Exam 1, Simple Exotics and Convertible Bonds have been excluded from the syllabus. You may choose to ignore this question. It appears here solely because the Handbook continues to have these chapters.]
What is the current conversion premium for a convertible bond where \$100 in market value of the bond is convertible into two shares and the current share price is \$50?
A. None of the above
B. 0C. 1D. 0.5
Answer: C
Explanation: Explanation Since \$100 is convertible into two shares, the price upon conversion per share is \$50, which is the same as the current share price. Therefore there is no premium, and Choice 'c' is the correct answer.

NEW QUESTION: 2ABC.com boasts a two-node Network Load Balancing cluster which is called web.CK1.com. The purpose of this cluster is to provide load balancing and high availability of the intranet website only. With monitoring the cluster, you discover that the users can view the Network Load Balancing cluster in their Network Neighborhood and they can use it to connect to various services by using the name web.CK1.com. You also discover that there is only one port rule configured for Network Load Balancing cluster. You have to configure web.CK1.com NLB cluster to accept HTTP traffic only. Which two actions should you perform to achieve this objective? (Choose two answers. Each answer is part of the complete solution)
A. Assign a unique port rule for NLB cluster by using the NLB Cluster console
B. Delete the default port rules through Network Load Balancing Cluster console
C. Create a new rule for TCP port 80 by using the Network Load Balancing Cluster console
D. Run the wlbs disable command on the cluster nodes
Answer: B, C
Explanation: <http://technet.microsoft.com/en-us/library/cc733056.aspx>
Create a new Network Load Balancing Port Rule Port rules control how a Network Load Balancing (NLB) cluster functions. To maximize control of various types of TCP/IP traffic, you can set up port rules to control how each port's cluster-network traffic is handled. The method by which a port's network traffic is handled is called its filtering mode. There are three possible filtering modes: Multiple hosts, Single host, and Disabled. You can also specify that a filtering mode apply to a numerical range of ports. You do this by defining a port rule with a set of configuration parameters that define the filtering mode. Each rule consists of the following

configuration parameters: The virtual IP address that the rule should apply to The TCP or UDP port range that this rule should apply to The protocols that this rule should apply to, including TCP, UDP, or both The filtering mode that specifies how the cluster handles traffic, which is described by the port range and the protocols In addition, you can select one of three options for client affinity: None, Single, or Network. Single and Network are used to ensure that all network traffic from a particular client is directed to the same cluster host. To allow NLB to properly handle IP fragments, you should avoid using None when you select UDP or Both for your protocol setting. As an extension to the Single and Network options, you can configure a time-out setting to preserve client affinity when the configuration of an NLB cluster is changed. This extension also allows clients to keep affinity to a cluster host even if there are no active, existing connections from the client to the host.
