(Choose two)**A.** Ensure that there is a Contrail policy between the two virtual networks.**B.** Execute the tcpdump command on the virtual machine's tap interface.**C.** Ensure that the SDN gateway has the VRF or VRFs created for the two virtual networks.**D.** Ensure that there is a default route in each virtual network's VRF.**Answer: A,C**

NEW QUESTION: 4How does a switch differ from a hub?**A.** A switch decreases the number of collision domains.**B.** A switch decreases the number of broadcast domains.**C.** A switch does not induce any latency into the frame transfer time.**D.** A switch operates at a lower, more efficient layer of the OSI model.**E.** A switch tracks MAC addresses of directly-connected devices.**Answer: E**
EExplanation:Some of the features and functions of a switch include:A switch is essentially a fast, multi-port bridge, which can contain dozens of ports.Rather than creating two collision domains, each port creates its own collision domain.In a network of twenty nodes, twenty collision domains exist if each node is plugged into its own switch port.If an uplink port is included, one switch creates twenty-one single-node collision domains.A switch dynamically builds and maintains a Content-Addressable Memory (CAM) table, holding all of the necessary MAC information for each port.For a detailed description of how switches operate, and their key differences to hubs, see the reference link below.Reference:
