NEW QUESTION: 1class Fibonacci extends RecursiveTask<Integer> {final int n;Fibonacci (int n) { this.n = n }Integer compute () {if (n <= 1)return n;Fibonacci f1 = new Fibonacci (n - 1);f1.fork; Fibonacci f2 = new Fibonacci (n - 2);return f2.compute() + f1.join; // Line **}}Assume that line ** is replaced with:return f1.join() + f2.compute(); // Line ****A. Option B****B. Option E****C. Option A****D. Option F****E. Option D****F. Option C****Answer: A**Explanation:Changing the code is not useful. In the original code (return f2.compute() + f1.join;) f1 and f2 are run in parallel. The result is joined. With the changed code (return f1.join() + f2.compute();) f1 is first executed and finished, then is f2 executed. Note 1: The join method allows one thread to wait for the completion of another. If t is a Thread object whose thread is currently executing, t.join(); causes the current thread to pause execution until t's thread terminates. Note 2: New in the Java SE 7 release, the fork/join framework is an implementation of the ExecutorService interface that helps you take advantage of multiple processors. It is designed for work that can be broken into smaller pieces recursively. The goal is to use all the available processing power to enhance the performance of your application. As with any ExecutorService, the fork/join framework distributes tasks to worker threads in a thread pool. The fork/join framework is distinct because it uses a work-stealing algorithm. Worker threads that run out of things to do can steal tasks from other threads that are still busy. Reference: The Java Tutorials, Joins, Fork/Join
