NEW QUESTION: 1 Which three values can be used to tag external EIGRP routes? (Choose three.)
A. The protocol ID of the external protocol
B. The administrative distance of the external protocol
C. The metric from the external protocol
D. The router ID of the router that redistributed the route
E. The router ID of the router from which the external protocol route was learned
F. The cost to reach the router that redistributed the route
Answer: A,C,D,E
Explanation: EIGRP has the notion of internal and external routes. Internal routes are ones that have been originated within an EIGRP autonomous system (AS). Therefore, a directly attached network that is configured to run EIGRP is considered an internal route and is propagated with this information throughout the EIGRP AS. External routes are ones that have been learned by another routing protocol or reside in the routing table as static routes. These routes are tagged individually with the identity of their origination. External routes are tagged with the following information: The router ID of the EIGRP router that redistributed the route. The AS number where the destination resides. A configurable administrator tag. Protocol ID of the external protocol. The metric from the external protocol. Bit flags for default routing.

NEW QUESTION: 3 A company is implementing an Amazon ECS cluster to run its workload. The company architecture will run multiple ECS services on the cluster, with an Application Load Balancer on the front end, using multiple target groups to route traffic. The Application Development team has been struggling to collect logs that must be collected and sent to an Amazon S3 bucket for near-real time analysis. What must the DevOps Engineer configure in the deployment to meet these requirements? (Select THREE)
A. Create an Amazon Kinesis Data Firehose with a destination of the S3 logging bucket, then create an Amazon CloudWatch Logs subscription filter for Kinesis
B. Use Amazon CloudWatch Events to schedule an AWS Lambda function that will run every 60 seconds running the create-export -task CloudWatch Logs command, then point the output to the logging S3 bucket.
C. Enable access logging on the target groups that are used by the ECS services, then point it directly to the S3 logging bucket.
D. Install the Amazon CloudWatch Logs logging agent on the ECS instances. Change the logging driver in the ECS task definition to 'awslogs'.
E. Download the Amazon CloudWatch Logs container instance from AWS and configure it as a task. Update the application service definitions to include the logging task.
F. Enable access logging on the Application Load Balancer, then point it directly to the S3 logging bucket.
