G. The cluster quorum settings
H. Live migration

J. The Handling priority
K. The host priority
L. The failover settings
Answer: D
Explanation: Explanation Scale-Out File Server is a feature that is designed to provide scale-out file shares that are continuously available for file-based server application storage. Scale-out file shares provides the ability to share the same folder from multiple nodes of the same cluster. Note: You can deploy and configure a clustered file server by using either of the following methods:
* Scale-Out File Server for Application data (Scale-Out File Server)
* File Server for general use
Scale-Out File Server for Application data (Scale-Out File Server) This clustered file server is introduced in Windows Server 2012 R2 and lets you store server Application data, such as Hyper-V virtual machine files, on file shares, and obtain a similar level of reliability, availability, manageability, and high performance that you would expect from a storage area network. All file shares are online on all nodes simultaneously. File shares associated with this type of clustered file server are called scale-out file shares. This is sometimes referred to as active-active. Reference: Scale-Out File Server for Application Data Overview <http://technet.microsoft.com/en-us/library/hh831349.aspx>
