**NEW QUESTION: 3**Drag and drop characteristics of PIM dense mode from the left to the right.**Answer:** Explanation: Explanation PIM-DM supports only source trees - that is, (S,G) entries - and cannot be used to build a shared distribution tree. Reference: [https://www.cisco.com/c/en/us/td/docs/ios-xml/ios/ipmulti\\_pim/configuration/xe-16-5/imc-pim-xe-16-5-book/im](https://www.cisco.com/c/en/us/td/docs/ios-xml/ios/ipmulti_pim/configuration/xe-16-5/imc-pim-xe-16-5-book/im) PIM dense mode (PIM-DM) uses a push model to flood multicast traffic to every corner of the network. This push model is a brute-force method of delivering data to the receivers. This method would be efficient in certain deployments in which there are active receivers on every subnet in the network. PIM-DM initially floods multicast traffic throughout the network. Routers that have no downstream neighbors prune the unwanted traffic. This process repeats every 3 minutes. A rendezvous point (RP) is required only in networks running Protocol Independent Multicast sparse mode (PIM-SM). In PIM dense mode (PIM-DM), multicast traffic is initially flooded to all segments of the network. Routers that have no downstream neighbors or directly connected receivers prune back the unwanted traffic.
