NEW QUESTION: 1You are a database developer for a database named Sales hosted on a SQL Server 2008 server. The Sales database includes the Exams and ExamQuestions tables. If any questions are modified for an exam, you need to ensure that the ExamModifiedDate in the Exams table is updated with the date and time of the update. The ExamQuestions table includes an INSTEAD OF trigger that records when and who last modified each question. Therefore, you decide to create a trigger. You only want the trigger to fire if a constraint violation has not occurred. Which of the following code will create the trigger to meet your goals?
A. CREATE TRIGGER trgExamQuestionsModified ON dbo.ExamQuestions INSTEAD OF UPDATE NOT FOR REPLICATION AS UPDATE Exams SET ExamModifiedDate = GetDate() FROM inserted WHERE inserted.ExamID = Exams.ExamID
B. CREATE TRIGGER trgExamQuestionsModified ON dbo.Exams AFTER UPDATE NOT FOR REPLICATION AS UPDATE Exams SET ExamModifiedDate = GetDate() FROM inserted WHERE inserted.ExamID = Exams.ExamID
C. CREATE TRIGGER trgExamQuestionsModified ON dbo.ExamQuestions AFTER UPDATE FOR REPLICATION AS UPDATE Exams SET ExamModifiedDate = GetDate() FROM inserted WHERE inserted.ExamID = Exams.ExamID
D. CREATE TRIGGER trgExamQuestionsModified ON dbo.ExamQuestions AFTER UPDATE NOT FOR REPLICATION AS UPDATE Exams SET ExamModifiedDate = GetDate() FROM inserted WHERE inserted.ExamID = Exams.ExamID
Answer: D
Explanation:The syntax The DML trigger is created on the ExamQuestions table as it should be. AFTER UPDATE is used to ensure that the trigger will only fire after constraints are checked and succeed. In other words, if the UPDATE fails because it does not meet the constraint checks, the trigger will not fire. In contrast, the INSTEAD OF trigger will fire even if the UPDATE would violate constraints since constraints are not checked. While replication is not specifically mentioned in the question, you can specify NOT FOR REPLICATION if the table(s) are involved in replication. The NOT FOR REPLICATION clause indicates that the trigger should not be executed when a replication agent modifies the table that is involved in the trigger.

NEW QUESTION: 2**A.** Geography**B.** Geoproximity**C.** Localization**D.** Geodiversity
Answer: B
Explanation:Azure allows specification of geographical regions or affinity groups. Geographical regions are related to the data centers, like North Central US, South Central US, Anywhere US, East Asia, North Europe, and so on. The list of options will grow as more data centers are added.

Instead of selecting a region, it is possible to specify an affinity group. Affinity groups are hints to Azure that essentially state that everything within the group should be as close in proximity as Azure will allow. That usually means keeping items within the same data center, which besides having the benefit of geo-location, can sometimes offer performance improvements for communication. References:
