Difficulty finding the right Salesforce Revenue-Cloud-Consultant-Accredited-Professional answers, You can use your smart phones, laptops, the tablet computers or other equipment to download and learn our Revenue-Cloud-Consultant-Accredited-Professional learning dump.

More choices available, Get the most relevant answers to Revenue-Cloud-Consultant-Accredited-Professional Latest Exam Question the questions and increase your understanding of the exam, Day by day, you will be thought highly by your boss.

NEW QUESTION: 1 Composite X invokes an outbound DB adapter to write data to a database table. You have configured JCA at the binding component as follows: `<property name = "jca.retry.count" type = "xs:int" many = "false" override = "may" > 2</property><property name = "jca.retry.interval" type = "xs:int" many = "false" override = "may" > 2</property>` You have also modeled a modeled a fault policy to retry the invocation three times in case of remoteFault as follows: `<retryCount>3</retryCount> <retryInterval>3</retryInterval>` Which result describes what happens when the database that is being accessed by the above binding component goes down?
A. The fault policy retries occur within the JCA retries. So two JCA retries are executed two seconds apart. Within each JCA retry, three fault policy retries are executed three seconds apart.
B. The invocation is retried for a total of six times every two seconds.
C. The invocation is retrieved for a total of two times every two seconds. Fault policy retries are ignored.
D. The invocation is retried for a total of six times every three seconds.
E. The JCA retries occur within the fault policy retries. So three fault policy retries are executed three seconds apart. Within each fault policy retry, two JCA retries are executed two seconds apart.
Answer: E
Explanation:Note: *Global retries for any error handling are returned to the BPEL Receive activity instance, for example, or, more generally, to the point at which the transaction started. Such a retry could occur if there was an error such as a temporary database fault. The default retry count is by default indefinite, or specified in the jca.retry.count property.
*Properties you can specify in the composite.xml file include:/jca.retry.count Specifies the

maximum number of retries before rejection. Again, specifying this value is a prerequisite to specifying the other property values./jca.retry.intervalSpecifies the time interval between retries (measured in seconds.)* A remoteFault is also thrown inside an activity. It is thrown because the invocation fails. For example, a SOAP fault is returned by the remote service.

NEW QUESTION: 2What is a principle of business performance management?**A.** Defines measures that may be subjective or objective**B.** Measures how well a business is performing against objectives**C.** Requires threshold settings to be established by IT**D.** Considers financial earnings as an essential input**Answer: B**
