**NEW QUESTION: 1**Your company hires a new human resources consultant. Corporate policy specifies the following requirements for consultants:In the Office 365 admin center, you create an account for the consultant and assign an E3 license to the account. You send instructions to the consultant for installing Office365 ProPlus on her laptop.The consultant signs in to the Office 365 portal and changes her password when prompted to do so. She successfully accesses her email by using Outlook Web App (OWA). She attempts to install Office 365 ProPlus, but is unable to do so.The Software page of the Office 365 portal displays the options shown in the following image.You need to ensure that the consultant can install Office 365 ProPlus.What should you do?**A.** License the consultant's account for Office 365 ProPlus.**B.** License the consultant's account for Office Web Apps.**C.** Assign an E1 license to the consultant's account.**D.** Issue a corporate laptop to the consultant and have her restart the Office 365 ProPlus installation process on that laptop.**Answer: A****Explanation:**When assigning a license to a user, you are able to select which services are enabled by that license. Select the down-arrow next to the name of the license and unselect the services that you want to restrict from that user. The Office 365 ProPlus check box was probably de-selected, therefore the user was unable to install it.

**NEW QUESTION: 3**According to company policy an administrator must logically keep the Human Resources department separated from the Accounting department. Which of the following would be the simplest way to accomplish this?**A.** NAT**B.** DMZ**C.** VLAN**D.** NIDS**Answer: C****Explanation:**Explanation: A virtual local area network (VLAN) is a hardware-imposed network segmentation created by switches.

**NEW QUESTION: 4**A security administrator is given the security and availability profiles for servers that are being deployed.\* Match each RAID type with the correct configuration and MINIMUM number of drives.\* Review the server profiles and match them with the appropriate

RAID type based on integrity, availability, I/O, storage requirements. Instructions: \* All drive definitions can be dragged as many times as necessary \* Not all placeholders may be filled in the RAID configuration boxes \* If parity is required, please select the appropriate number of parity checkboxes \* Server profiles may be dragged only oncel at any time you would like to bring back the initial state of the simulation, please select the Reset button. When you have completed the simulation, please select the Done button to submit. Once the simulation is submitted, please select the Next button to continue. **Answer:** Explanation: Explanation RAID-0 is known as striping. It is not a fault tolerant solution but does improve disk performance for read/write operations. Striping requires a minimum of two disks and does not use parity. RAID-0 can be used where performance is required over fault tolerance, such as a media streaming server. RAID-1 is known as mirroring because the same data is written to two disks so that the two disks have identical data. This is a fault tolerant solution that halves the storage space. A minimum of two disks are used in mirroring and does not use parity. RAID-1 can be used where fault tolerance is required over performance, such as on an authentication server. RAID-5 is a fault tolerant solution that uses parity and striping. A minimum of three disks are required for RAID-5 with one disk's worth of space being used for parity information. However, the parity information is distributed across all the disks. RAID-5 can recover from a sing disk failure. RAID-6 is a fault tolerant solution that uses dual parity and striping. A minimum of four disks are required for RAID-6. Dual parity allows RAID-6 to recover from the simultaneous failure of up to two disks. Critical data should be stored on a RAID-6 system.
