NEW QUESTION: 1You have several SQL Server queries.You plan to optimize the queries to improve performance.You run the queries in SQL Server Management Studio.You need to compare query runs to expose the indexing issues of the queries.Which three actions should you perform from SQL Server Management Studio? Each correct answer presents part of the solution.**A.** Enable the Include Actual Execution Plan option.**B.** Add the STATISTICS TIME execution setting to the query.**C.** Add the STATISTICS PROFILE execution setting to the query.**D.** Add the STATISTICS IO execution setting to the query.**E.** Enable the Debug option.**Answer: A,B,D**
Explanation:ExplanationE: An execution plan is the result of the query optimizer's attempt to calculate the most efficient way to implement the request represented by the T-SQL query you submitted. To generate the first execution plan, you can enable the Include Actual Execution Plan option.B: SET STATISTICS TIME displays the number of milliseconds required to parse, compile, and execute each statement.C: STATISTICS IO causes SQL Server to display information regarding the amount of disk activity generated by Transact-SQL statements. This is useful information for optimizing queries.The information include Scan count: Number of seeks/scans started after reaching the leaf level in any direction to retrieve all the values to construct the final dataset for the output.Scan count is 0 if the index used is a unique index or clustered index on a primary key and you are seeking for only one value. For example WHERE Primary_Key_Column = <value>.Scan count is 1 when you are searching for one value using a non-unique clustered index which is defined on a non-primary key column. This is done to check for duplicate values for the key value that you are searching for. For example WHERE Clustered_Index_Key_Column = <value>.Scan count is N when N is the number of different seek/scan started towards the left or right side at the leaf level after locating a key value using the index key.
