NEW QUESTION: 2Which of the following items is NOT a benefit of cold sites?**A.** No resource contention with other organisation**B.** Quick Recovery**C.** A secondary location is available to reconstruct the environment**D.** Low Cost**Answer: B**Explanation:Explanation/Reference:A cold site is a permanent location that provide you with your own space that you can move into in case of a disaster or catastrophe. It is one of the cheapest solution available as a rental place but it is also the one that would take the most time to recover. A cold site usually takes one to two weeks for recovery.Although major disruptions with long-term effects may be rare, they should be accounted for in the contingency plan. The plan should include a strategy to recover and perform system operations at an alternate facility for an extended period. In general, three types of alternate sites are available:Dedicated site owned or operated by the organization. Also called redundant or alternate sites; Reciprocal agreement or memorandum of agreement with an internal or external entity; and Commercially leased facility.Regardless of the type of alternate site chosen, the facility must be able to support system operations as defined in the contingency plan. The three alternate site types commonly categorized in terms of their operational readiness are cold sites, warm sites, or hot sites. Other variations or combinations of these can be found, but generally all variations retain similar core features found in one of these three site types.Progressing from basic to advanced, the sites are described below:Cold Sites are typically facilities with adequate space and infrastructure (electric power, telecommunications connections, and environmental controls) to support information system recovery activities.fWarm Sites are partially equipped office spaces that contain some or all of the system hardware, software, telecommunications, and power sources.Hot Sites are facilities

appropriately sized to support system requirements and configured with the necessary system hardware, supporting infrastructure, and support personnel. As discussed above, these three alternate site types are the most common. There are also variations, and hybrid mixtures of features from any one of the three. Each organization should evaluate its core requirements in order to establish the most effective solution. Two examples of variations to the site types are:

- Mobile Sites are self-contained, transportable shells custom-fitted with specific telecommunications and system equipment necessary to meet system requirements.
- Mirrored Sites are fully redundant facilities with automated real-time information mirroring. Mirrored sites are identical to the primary site in all technical respects. There are obvious cost and ready-time differences among the options. In these examples, the mirrored site is the most expensive choice, but it ensures virtually 100 percent availability. Cold sites are the least expensive to maintain, although they may require substantial time to acquire and install necessary equipment. Partially equipped sites, such as warm sites, fall in the middle of the spectrum. In many cases, mobile sites may be delivered to the desired location within 24 hours, but the time necessary for equipment installation and setup can increase this response time. The selection of fixed-site locations should account for the time and mode of transportation necessary to move personnel and/or equipment there. In addition, the fixed site should be in a geographic area that is unlikely to be negatively affected by the same hazard as the organization's primary site.

NEW QUESTION: 3---You have a computer named Computer1 that runs Windows 7. Computer1 has Remote Desktop enabled. Computer1 has a shared printer named Printer1. A group named HRUsers is a member of the Remote Desktop Users group. Only HRUsers has access to Printer1. A user named User1 is a member of HRUsers. You need to configure the computer to meet the following requirements: Allow User1 to print to Printer1 Prevent User1 from establishing Remote Desktop sessions to Computer1 Allow other members of HRUsers to connect to Computer1 by using Remote Desktop What should you do? **A.** Assign User1 the Deny access to this computer from the network user right. Assign HRUsers the Allow log on locally user right. **B.** Assign User1 the Deny log on through Remote Desktop Services user right. **C.** Remove User1 from the HRUsers group. **D.** Remove HRUsers from the Remote Desktop Users group. **Answer: B**

NEW QUESTION: 4You have an Exchange Server 2013 organization that contains two servers. The servers are configured as shown in the following table. EX1 and EX2 are members of a database availability group (DAG) named DAG1. You have a database named DB1 that replicates to EX1 and EX2. EX1 fails. You discover that DB1 does not mount on EX2. You view the status of the mailbox databases as shown in the following table. You need to ensure that the database attempts to mount on EX2 if EX1 fails. What should you change? **A.** The activation preference of DB1EX1 **B.** The AutoDatabaseMountDial setting to Lossless **C.** The activation preference of DB1EX2 **D.** The AutoDatabaseMountDial setting to BestAvailability **Answer: D** Explanation: *The MailboxServer.AutoDatabaseMountDial property gets or sets the automatic database mount behavior for an Exchange server that is running the Mailbox server role in a continuous replication environment after a database failover. *The AutoDatabaseMountDial property specifies the automatic database mount behavior of a Mailbox server after a failover. Each behavior is based on the copy queue length, or the number of logs that are recognized by the passive copy that need to be replicated. If the copy queue length is greater than the value specified for the behavior, the database does not automatically mount. If the copy queue length is less than or equal to the value specified for the behavior, the Mailbox server tries to copy the remaining logs to the passive copy and mounts the database. *BestAvailability The database automatically mounts immediately after a failover if the queue length is less than or equal to 12. Incorrect: Not A: Lossless The database does not automatically mount until all logs generated on the active device are copied to the passive device You have an Exchange Server 2013 organization.
