NEW QUESTION: 1Scenario: A Citrix Architect needs to design a multi-datacenter XenApp and XenDesktop environment that will use Provisioning Services (PVS) to manage Virtual Delivery Agent (VDA) machine images. Each datacenter will have a separate Provisioning Services farm. During the design discussions, the architect creates a diagram to depict the way vDisk files will be replicated between PVS farms, based on the available storage for the vDisk Stores. Click the Exhibit button to view the diagram. Overall, the customer has identified the following objectives for the image replication process: Minimize the administrative time required to replicate images between farms Must be usable by PVS farm administrators based on native tools Minimize network traffic between datacenters Which method should the architect use to replicate the vDisk files between datacenters? **A.** SAN replication **B.** Manual copy **C.** Scheduled robocopy commands **D.** vDisk Replicator Tool **E.** Microsoft DFS-R **Answer: D** Explanation: The vDisk Replicator Tool is not designed to replicate vDisks within a Site, and does not support vDisk stores that reside on shared storage. Administrators must have local administrator rights on each PVS server, as well as PVS administrator rights on both the "source" and "destination" Farms

NEW QUESTION: 3 Which two mechanisms can be used to eliminate Cisco Express Forwarding polarization? (Choose two.) **A.** different hashing inputs at each layer of the network **B.** the unique-ID/universal-ID algorithm **C.** alternating cost links **D.** Cisco Express Forwarding antipolarization **Answer: A, B** Explanation: This document describes how Cisco Express Forwarding (CEF) polarization can cause suboptimal use of redundant paths to a destination network. CEF polarization is the effect when a hash algorithm chooses a particular path and the redundant paths remain completely unused. How to Avoid CEF Polarization The hash algorithm load-balances this way by default: 1: 12: 7-83: 1-1-14: 1-1-1-25: 1-1-1-1-16: 1-2-2-2-2-27: 1-1-1-1-1-1-18: 1-1-1-2-2-2-2-2-2 The number before the colon represents the number of equal-cost paths. The number after the colon represents the proportion of traffic which is forwarded per path. This means that: This illustrates that, when there is even number of ECMP links, the traffic is not load-balanced.
