NEW QUESTION: 1What are two benefits of using NAT? (Choose two.)**A.** NAT protects network security because private networks are not advertised.**B.** Dynamic NAT facilitates connections from the outside of the network.**C.** NAT facilitates end-to-end communication when IPsec is enabled.**D.** NAT accelerates the routing process because no modifications are made on the packets.**E.** NAT eliminates the need to re-address all hosts that require external access.**F.** NAT conserves addresses through host MAC-level multiplexing.**Answer: A,E**Explanation:By not revealing the internal Ip addresses, NAT adds some security to the inside network -> F is correct.NAT has to modify the source IP addresses in the packets -> E is not correct.Connection from the outside of the network through a "NAT" network is more difficult than a more network because IP addresses of inside hosts are hidden -> C is not correct.In order for IPsec to work with NAT we need to allow additional protocols, including Internet Key Exchange (IKE), Encapsulating Security Payload (ESP) and Authentication Header (AH) -> more complex -> A is not correct.By allocating specific public IP addresses to inside hosts, NAT eliminates the need to re-address the inside hosts -> B is correct.NAT does conserve addresses but not through host MAC-level multiplexing. It conserves addresses by allowing many private IP addresses to use the same public IP address to go to the Internet -> C is not correct.
