NEW QUESTION: 1 Windows LAN Manager (LM) hashes are known to be weak. Which of the following are known weaknesses of LM? (Choose three) **A.** Hashes are sent in clear text over the network. **B.** Makes use of only 32 bit encryption. **C.** Converts passwords to uppercase. **D.** Effective length is 7 characters. **Answer: A,C,D** Explanation: The LM hash is computed as follows. 1. The user's password as an OEM string is converted to uppercase. 2. This password is either null-padded or truncated to 14 bytes. 3. The "fixed-length" password is split into two 7-byte halves. 4. These values are used to create two DES keys, one from each 7-byte half. 5. Each of these keys is used to DES-encrypt the constant ASCII string "KGS!@#\$%", resulting in two 8-byte ciphertext values. 6. These two ciphertext values are concatenated to form a 16-byte value, which is the LM hash. The hashes themselves are sent in clear text over the network instead of sending the password in clear text.
