NEW QUESTION: 1 A user has created a VPC with CIDR 20.0.0.0/16. The user has created one subnet with CIDR 20.0.0.0/16 in this VPC. The user is trying to create another subnet with the same VPC for CIDR 20.0.0.1/24. What will happen in this scenario? **A.** The second subnet will be created **B.** It will throw a CIDR overlaps error **C.** It is not possible to create a subnet with the same CIDR as VPC **D.** The VPC will modify the first subnet CIDR automatically to allow the second subnet IP range **Answer: B** **Explanation:** A Virtual Private Cloud (VPC) is a virtual network dedicated to the user's AWS account. A user can create a subnet with VPC and launch instances inside that subnet. The user can create a subnet with the same size of VPC. However, he cannot create any other subnet since the CIDR of the second subnet will conflict with the first subnet. Reference: http://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPC_Subnets.html

NEW QUESTION: 2 Which three statements are true about Clusterware resource debugging? **A.** The crsctl command can be used to set debugging for Clusterware resources by using the following syntax: crsctl set log resource "resource_name:logging_level". **B.** Enabling logging for Clusterware resources can negatively affect cluster performance, so it should be used only when required. **C.** Although the crsctl command can be used to dynamically affect logging for Clusterware resources, you can also configure resource debugging automatically by specifying a logging_level clause in the Grid_Home/log/hostname/admin/clscfg.ini file. **D.** After collecting debugging data for a specific Clusterware resource, terminate the collection of debugging data by issuing the crsctl set log resource "resource_name:stop" command. **E.** Debugging cannot be set for user-defined resources. **Answer: A, B, C** **Explanation:** Enabling Resource Debugging Change the USR_ORA_DEBUG resource attribute to 1 for specific resources: # crsctl set log res "ora.host01.vip:1" After you capture all trace information, change the debug attribute back to 0: # crsctl set log res "ora.host01.vip:0" You can use an initialization file to configure debugging. The initialization file name includes the name of the process that you are debugging (process_name.ini). The file is located in the <Grid_Home>/log/host_name/admin/ directory. Oracle Support may request that you enable tracing to capture additional information for

problem resolution with Oracle Clusterware resources. Because the procedures described here may affect performance, perform these activities only with the assistance of Oracle Support. The initialization file name includes the name of the process that you are debugging (process_name.ini). The file is located in the <Grid_Home>/log/host_name/admin/ directory. For example, the name for the CLSCFG debugging initialization file on node1 would be: <Grid_Home>/log/node1/admin/clscfg.iniD60488GC11Oracle 11g: RAC and Grid Infrastructure Administration Accelerated 6 - 13

NEW QUESTION: 3 Your network contains an Active Directory forest named contoso.com. The forest contains four sites named Site1, Site2, Site3, and Site4.
