NEW QUESTION: 1Which statements describe the routing protocol OSPF? (Choose three.)**A.** It allows extensive control of routing updates.**B.** It increases routing overhead on the network.**C.** It is simpler to configure than RIP v2.**D.** It is used to route between autonomous systems.**E.** It supports VLSM.**F.** It confines network instability to one area of the network.**Answer: A,E,F**
Explanation:Routing overhead is the amount of information needed to describe the changes in a dynamic network topology. All routers in an OSPF area have identical copies of the topology database and the topology database of one area is hidden from the rest of the areas to reduce routing overhead because fewer routing updates are sent and smaller routing trees are computed and maintained (allow extensive control of routing updates and confine network instability to one area of the network).

NEW QUESTION: 2HOTSPOTYou manage an Azure Web Site for a consumer-product company. The website runs in Standard mode on a single medium instance.You expect increased traffic to the website due to an upcoming sale during a holiday weekend.You need to ensure that the website performs optimally when user activity is at its highest.Which option should you select? To answer, select the appropriate option in the answer area.**Answer:** Explanation:Note: The 'small' instance is selected. This setting would be for the weekdays.
