NEW QUESTION: 2A. NTP**B.** IPv4 OSPF Routing**C.** IPv6 OSPF Routing**D.** IPv4 layer 3 security
Answer: CExplanation:ExplanationSince we are unable to ping the IPv6 address, the problem is with IPv6 OSPF Routing.Topic 14, Ticket 15: IPv6 Routing Issue 2Topology Overview (Actual Troubleshooting lab design is for below network design)* Client Should have IP 10.2.1.3* EIGRP 100 is running between switch DSW1 & DSW2* OSPF (Process ID 1) is running between R1, R2, R3, R4* Network of OSPF is redistributed in EIGRP* BGP 65001 is configured on R1 with Webserver cloud AS 65002* HSRP is running between DSW1 & DSW2 SwitchesThe company has created the test bed shown in the layer 2 and layer 3 topology exhibits.This network consists of four routers, two layer 3 switches and two layer 2 switches.In the IPv4 layer 3 topology, R1, R2, R3, and R4 are running OSPF with an OSPF process number 1.DSW1, DSW2 and R4 are running EIGRP with an AS of 10. Redistribution is enabled where necessary.R1 is running a BGP AS with a number of 65001. This AS has an eBGP connection to AS 65002 in the ISP's network. Because the company's address space is in the private range.R1 is also providing NAT translations between the inside (10.1.0.0/16 & 10.2.0.0/16) networks and outside (209.65.0.0/24) network. ASW1 and ASW2 are layer 2 switches.NTP is enabled on all devices with 209.65.200.226 serving as the master clock source.The client workstations receive their IP address and default gateway via R4's DHCP server.The default gateway address of 10.2.1.254 is the IP address of HSRP group 10 which is running on DSW1 and DSW2.In the IPv6 layer 3 topology R1, R2, and R3 are running OSPFv3 with an OSPF process number 6.DSW1, DSW2 and R4 are running RIPng process name RIP_ZONE.The two IPv6 routing domains, OSPF 6 and RIPng are connected via GRE tunnel running over the underlying IPv4 OSPF domain. Redistrution is enabled where necessary. Recently the implementation group has been using the test bed to do a 'proof-of-concept' on several implementations. This involved changing the configuration on one or more of the devices. You will be presented with a series of trouble tickets related to issues introduced

during these configurations. Note: Although trouble tickets have many similar fault indications, each ticket has its own issue and solution. Each ticket has 3 sub questions that need to be answered & topology remains same. Question-1 Fault is found on which device, Question-2 Fault condition is related to, Question-3 What exact problem is seen & what needs to be done for solution

NEW QUESTION: 3 You are performing feature scaling by using the scikit-learn Python library for x1, x2, and x3 features. Original and scaled data is shown in the following image. Use the drop-down menus to select the answer choice that answers each question based on the information presented in the graphic. NOTE: Each correct selection is worth one point. **Answer:** Explanation: Explanation Box 1: StandardScaler The StandardScaler assumes your data is normally distributed within each feature and will scale them such that the distribution is now centred around 0, with a standard deviation of 1. Example: All features are now on the same scale relative to one another. Box 2: Min Max Scaler Notice that the skewness of the distribution is maintained but the 3 distributions are brought into the same scale so that they overlap. Box 3: Normalizer References: <http://benalexkeen.com/feature-scaling-with-scikit-learn/>
