NEW QUESTION: 1A technician is dispatched to repair a computer that appears to boot correctly, except no video output is being displayed. No beep codes are given by the computer, but drive activity lights and keyboard lights work correctly. The technician decides that the video card may be defective and removes it from the computer, expecting the computer's POST process to provide beep codes with the card removed. Instead the computer boots properly. Which of the following is MOST likely the cause?**A.** Onboard video is present**B.** The RAM should be reseated**C.** The monitor is defective**D.** The onboard speaker is defective**Answer: A**

NEW QUESTION: 2あなたは営業担当者であり、Dynamics 565Salesを使用しています。次のリードレコードを使用しています。

ドロップダウンメニューを使用して、図に示されている情報に基づいて各質問に回答する回答の選択肢を選択します。注：正しい選択はそれぞれ1ポイントの価値があります。**Answer:**

Explanation:

NEW QUESTION: 3DRAG DROPThe voice gateway selects an inbound VoIP dial peer by matching the information elements in the setup message with the dial peer attributes. From the list on the left, drag the elements to the right and drop them in the order in which a voice gateway matches inbound calls. Not all options are used.**Answer:** Explanation:Explanation: Inbound Dial Peers Matching ProcessWhen the Cisco IOS router or gateway receives a call setup request, a dial peer match is made for the incoming call in order to facilitate routing the call to different session applications. This is not a digit-by-digit match; rather the full digit string received in the setup request is used to match against configured dial peers. The router or gateway matches the information elements in the setup message with the dial peer attributes to select an inbound dial peer. The router or gateway matches these items in this order:Called number (DNIS) with the incoming called-number command:First, the router or gateway attempts to match the called number of the call setup request with the configured incoming called-number of each dial peer. Because call setups always include DNIS information, it is recommended to use the incoming called-number command for inbound dial peer matching. This attribute has matching priority over the answer-address and destination-pattern commands.Calling Number (ANI) with the answer-address command:If no match is found in step 1, the router or gateway attempts to match the calling number of the call setup request with the answer-address of each dial peer. This attribute can be useful in situations where you want to match calls based on the calling number (originating).Calling Number (ANI) with the destination-pattern command:If no match is found in step 2, the router or gateway attempts to match the calling number of the call setup request to the destination-pattern of each dial peer. For more information about this, see the first bullet in the Dial Peer Additional Information section of this document.Voice-port (associated with the incoming call setup request) with configured dial peer port (applicable for inbound POTS call legs):If no match is found in the step 3, the router or gateway attempts to match the configured dial peer port to the voice-port associated with the incoming call. If multiple dial peers have the same port configured, the dial peer first added in the configuration is matched.If no match is found in the first four steps, then

the default dial peer 0 command is used.
