NEW QUESTION: 1 Simone Girau holds a callable bond and Chi Rigazio holds a puttable bond. Which of the following statements about the two investors is TRUE?
A. If yield volatility increases, the value of Rigazio's option will decrease.
B. Both investors calculate the value of the bond held by adding the value of the option to the value of a similar straight bond.
C. Girau's bond has less potential for price appreciation.
D. As the yield volatility increases, the value of both Girau's bond and the underlying option increases.
Answer: C
Explanation: Explanation/Reference: Explanation: When a bond has a call provision, the potential for price appreciation is reduced, because the call caps the price of the bond near the call price. Even if interest rates fall considerably, it is unlikely that investors would pay a price that exceeds the call price. The other statements are false. To calculate the value of a puttable bond, it is correct to add the option value to the value of a similar straight bond. However, to calculate the callable bond value, subtract the option value from that of a similar straight bond. As a result, when yield volatility increases (thus increasing the option value), the value of a callable bond decreases and the value of a puttable bond increases. A call option does benefit the issuer, but a put option benefits the holder. Embedded options (puts and calls) increase in value when volatility increases.

NEW QUESTION: 2 Given a service deployed on Oracle Cloud Infrastructure Container Engine for Kubernetes (OKE), which annotation should you add in the sample manifest file below to specify a 400 Mbps load balancer?
A. service.beta.kubernetes.io/oci-load-balancer-shape: 400Mbps
