RT1をSubnet1とSubnet2に適用します。

Answer: Explanation:ExplanationIP forwarding enables the virtual machine a network interface is attached to:* Receive network traffic not destined for one of the IP addresses assigned to any of the IP configurations assigned to the network interface.* Send network traffic with a different source IP address than the one assigned to one of a network interface's IP configurations.The setting must be enabled for every network interface that is attached to the virtual machine that receives traffic that the virtual machine needs to forward. A virtual machine can forward traffic whether it has multiple network interfaces or a single network interface attached to it.Box 1: YesThe routing table allows connections from VM3 to VM1 and VM2. And as IP forwarding is enabled on VM3, VM3 can connect to VM1.Box 2: NoVM3, which has IP forwarding, must be turned on, in order for VM2 to connect to VM1.Box 3: YesThe routing table allows connections from VM1 and VM2 to VM3. IP forwarding on VM3 allows VM1 to connect to VM2 via VM3.References:
