**NEW QUESTION: 1** Which option is the correct representation of the IPv6 address 2001:0000:150C:0000:0000:41B1:45A3:041D? **A.** 2001::150c::41b1:45a3:041d **B.** 2001:150c::41b1:45a3::41d **C.** 2001:0:150c::41b1:45a3:41d **D.** 2001:0:150c:0::41b1:45a3:04d1  
**Answer: C** Explanation: [http://www.cisco.com/web/strategy/docs/gov/IPv6\\_WP.pdf](http://www.cisco.com/web/strategy/docs/gov/IPv6_WP.pdf) Address Representation The first area to address is how to represent these 128 bits. Due to the size of the numbering space, hexadecimal numbers and colons were chosen to represent IPv6 addresses. An example IPv6 address is: 2001:0DB8:130F:0000:0000:7000:0000:140B Note the following: There is no case sensitivity. Lower case "a" means the same as capital "A". There are 16 bits in each grouping between the colons.- 8 fields \* 16 bits/field = 128 bits There are some accepted ways to shorten the representation of the above address: Leading zeroes can be omitted, so a field of zeroes can be represented by a single 0. Trailing zeroes must be represented. Successive fields of zeroes can be shortened down to "::". This shorthand representation can only occur once in the address. Taking these rules into account, the address shown above can be shortened to: 2001:0DB8:130F:0000:0000:7000:0000:140B  
2001:DB8:130F:0:0:7000:0:140B (Leading zeroes) 2001:DB8:130F:0:0:7000:0:140B (Trailing zeroes) 2001:DB8:130F::7000:0:140B (Successive field of zeroes)

**NEW QUESTION: 2** The Cisco AnyConnect client is unable to download an updated user profile from the ASA headend using IKEv2. What is the most likely cause of this problem? **A.** IKEv2 is not enabled on the group policy. **B.** User profile updates are not allowed with IKEv2. **C.** A new profile

must be created so that the adaptive security appliance can push it to the client on the next connection attempt. **D.** Client Services is not enabled on the adaptive security appliance.

**Answer: C**

**NEW QUESTION: 3A.** Option B **B.** Option D **C.** Option C **D.** Option A **Answer: D**

**NEW QUESTION: 4** DRAG DROP You are converting an existing ASP.NET web application to use the Azure Active Directory (AD) Access Control service for authentication. The application will authenticate users by using their Yahoo account credentials. You need to determine the correct payload for each stage of the authentication process. What should you do? To answer, drag the appropriate payload format to the correct location on the dialog box. Each payload format may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content. **Answer:** Explanation: Explanation: Azure AD can support password-based single sign on for any cloud-based app that has an HTML-based sign-in page. By using a custom browser plugin, AAD automates the user's sign in process via securely retrieving application credentials such as the username and the password from the directory, and enters these credentials into the application's sign in page on behalf of the user. Microsoft Azure Active Directory Access Control (also known as Access Control Service or ACS) supports federation with Yahoo! as an identity provider using the OpenID 2.0 authentication protocol.
