**NEW QUESTION: 1**You need to use Azure Automation State Configuration to manage the ongoing consistency of virtual machine configurations.Which five actions should you perform in sequence? To answer, move the appropriate action from the list of actions to the answer area and arrange them in the correct order.NOTE: More than one order of answer choices is correct. You will receive credit for any of the correct orders you select.**Answer:** Explanation: Explanation:Step 1: Upload a configuration to Azure Automation State Configuration.Import the configuration into the Automation account.Step 2: Compile a configuration into a node configuration.A DSC configuration defining that state must be compiled into one or more node configurations (MOF document), and placed on the Automation DSC Pull Server.Step 3: Onboard the virtual machines to Azure Automation State Configuration.Onboard the Azure VM for management with Azure Automation State Configuration Step 4: Assign the node configuration Step 5: Check the compliance status of the node Each time Azure Automation State Configuration performs a consistency check on a managed node, the node sends a status report back to the pull server. You can view these reports on the page for that node.On the blade for an individual report, you can see the following status information for the corresponding consistency check:The report status - whether the node is "Compliant", the configuration "Failed", or the node is "Not Compliant" References: <https://docs.microsoft.com/en-us/azure/automation/automation-dsc-getting-started>

**NEW QUESTION: 2**The WebShipAnywhere company currently has a manual Order-to-Ship process. The company is implementing Service-Oriented Integration architecture and, as part of that initiative, they are automating the Order-to-Ship process.Whenever an order ships, the Warehouse Management System (WMS) is manually updated to reflect that the order has been shipped. If the Inventory for any product that was part of the order drops below a threshold value, the WMS alerts the user via a pop-up screen indicating that the product inventory is low. When this happens, the user logs in to the Purchasing System (PS) and enters the need to order more of the product. Both the WMS and PS are thick-client, two-tier applications that use an Oracle database. As part of automating the Order-to-Ship process, the company would like to remove this manual step.What integration pattern(s) should be used to automate this manual step?**A.** Because both the WMS and the PS use Oracle database, the WMS should be modified to use a trigger to update the PS database whenever a low inventory is detected.**B.** The WMS

should be modified to create a "low-inventory" event and publish the event to a topic queue following the publish-and-subscribe pattern. An event handler registered for the "low-inventory" event then receives the event and updates the PS.C. The polling integration pattern should be used to detect that the inventory for a product is low in the WMS. If a product inventory is low, the polling component uses a reliable-one-way message to call an SOA Service that updates the PS.D. The polling integration pattern should be used to detect that the inventory for a product is low in the VMS. If a product inventory is low, a "low-inventory" event should be created and published to a topic queue following the publish-and-subscribe pattern. An event handler registered for the "low inventory" event then receives the event and updates the PS.E. It is not possible to integrate thick-client, two-tier applications (such as VMS and PS) by using a SOI architecture. Only applications with service interfaces can be included in an SOI architecture.

**Answer: C** Explanation: Explanation/Reference: Polling, using a reliable-one-way message, and using a SOA Service is a good solution. Incorrect answers: A, D: The publish-and-subscribe communication pattern is used when a single message is of interest to multiple consumers. Here there is a single consumer. E: This is a low level solution that would only be possible if the WMS application could access the database of the PS application. Note: Over the years there have been many different approaches used to integrate applications. Some of the approaches that proved to be particularly prevalent and successful have become known as integration patterns. There are entire books written on the different types of integration patterns. There are some patterns that are so common and so foundational that any integration architecture must support them. A) Message Exchange Patterns Message exchange patterns describe the order and sequence of messages passing between a service consumer and a service provider. The foundational message exchange patterns that the architecture must support include A1) One-way A2) Reliable one-way A3) Request-Response A4) Request Optional-Response B) Synchronous Communications C) Asynchronous Communications C1) Bridging Synchronous and Asynchronous C2) Store and Forward D) Publish and Subscribe E) Polling Reference: Oracle Reference Architecture, Service-Oriented Integration, Release 3.0
