Explanation: The code in the question is an example of a SQL Injection attack. The code `1=1` will always provide a value of true. This can be included in statement designed to return all rows in a SQL table. In this question, the administrator has implemented client-side input validation.

Client-side validation can be bypassed. It is much more difficult to bypass server-side input validation. SQL injection is a code injection technique, used to attack data-driven applications, in which malicious SQL statements are inserted into an entry field for execution (e.g. to dump the database contents to the attacker). SQL injection must exploit a security vulnerability in an application's software, for example, when user input is either incorrectly filtered for string literal escape characters embedded in SQL statements or user input is not strongly typed and unexpectedly executed. SQL injection is mostly known as an attack vector for websites but can be used to attack any type of SQL database.

App1 must authenticate by using Azure Active Directory (Azure AD). What should you do? To answer, select the appropriate options in the answer area. NOTE: Each correct selection is worth one point. **Answer:** Explanation: Explanation On App1: Turn on the managed identity To use Service Bus with managed identities, you need to assign the identity the role and the appropriate scope. The procedure in this section uses a simple application that runs under a managed identity and accesses Service Bus resources. Once the application is created, follow these steps: * Go to Settings and select Identity. * Select the Status to be On. * Select Save to save the setting. On Queue1: Configure Access Control (IAM) Azure Active Directory (Azure AD) authorizes access rights to secured resources through role-based access control (RBAC). Azure Service Bus defines a set of built-in RBAC roles that encompass common sets of permissions used to access Service Bus entities and you can also define custom roles for accessing the data. Assign RBAC roles using the Azure portal In the Azure portal, navigate to your Service Bus namespace. Select Access Control (IAM) on the left menu to display access control settings for the namespace. If you need to create a Service Bus namespace. Select the Role assignments tab to see the list of role assignments. Select the Add button on the toolbar and then select Add role assignment. Reference:
