NEW QUESTION: 1 Which option is a weakness in an information system that an attacker might leverage to gain unauthorized access to the system or its data? **A.** mitigation **B.** hack **C.** vulnerability **D.** risk **E.** exploit **Answer: C** **Explanation:** Explanation vulnerability A flaw or weakness in a system's design or implementation that could be exploited.

NEW QUESTION: 2 Greenbelt Processors had a beginning inventory of 798 units valued at a cost of 34,895. It purchased 4,474 units of new inventory worth 195,402 during the year. A year-end audit revealed that it had 853 units on hand. If Greenbelt uses the FIFO method, what was its COGS for the year? **A.** 193,042 **B.** 193,000 **C.** 193,027 **Answer: A** **Explanation:** Since Greenbelt has 853 units on hand at year-end, under FIFO they all belong to purchases made during the year. Unit price of purchases = $195,402 / 4,474 = 43.675$ Ending inventory = $853 \times 43.675 = 37,255$ COGS = BI + Purchases - EI = $34,895 + 195,402 - 37,255 = 193,042$.

NEW QUESTION: 3 Your network contains an Active Directory domain named contoso.com. The domain contains a file server named Server1 that runs Windows Server 2012 R2. You view the effective policy settings of Server1 as shown in the exhibit. (Click the Exhibit button.) You need to ensure that an entry is added to the event log whenever a local user account is created or deleted on Server1. What should you do? **A.** In Servers GPO, modify the Advanced Audit Configuration settings. **B.** In Servers GPO, modify the Audit Policy settings. **C.** On Server1, attach a task to the system log. **D.** On Server1, attach a task to the security log. **Answer: A** **Explanation:** When you use Advanced Audit Policy Configuration settings, you need to confirm that these settings are not overwritten by basic audit policy settings. The following procedure shows how to prevent conflicts by blocking the application of any basic audit policy settings. Enabling Advanced Audit Policy Configuration Basic and advanced audit policy configurations should not be mixed. As such, it's best practice to enable Audit: Force audit policy subcategory settings (Windows Vista or later) to override audit policy category settings in Group Policy to make sure that basic auditing is disabled. The setting can be found under Computer Configuration Policies Security Settings Local Policies Security Options, and sets the SCENoApplyLegacyAuditPolicy registry key to prevent basic auditing being applied using Group Policy and the Local Security Policy MMC snap-in. In Windows 7 and Windows Server 2008 R2, the number of audit settings for which success and failure can be tracked has increased to 53. Previously, there were nine basic auditing settings under Computer Configuration Policies Windows Settings Security Settings Local Policies Audit Policy. These 53 new settings allow you to select only the behaviors that you want to monitor and exclude audit results for behaviors that are of little or no concern to you, or behaviors that create an excessive number of log entries. In addition, because Windows 7 and Windows Server 2008 R2 security audit policy can be applied by using domain Group Policy, audit policy settings can be modified,

tested, and deployed to selected users and groups with relative simplicity. Audit Policy settings Any changes to user account and resource permissions. Any failed attempts for user logon. Any failed attempts for resource access. Any modification to the system files. Advanced Audit Configuration Settings Audit compliance with important business-related and security-related rules by tracking precisely defined activities, such as: A group administrator has modified settings or data on servers that contain financial information. An employee within a defined group has accessed an important file. The correct system access control list (SACL) is applied to every file and folder or registry key on a computer or file share as a verifiable safeguard against undetected access. In Servers GPO, modify the Audit Policy settings - enabling audit account management setting will generate events about account creation, deletion and so on. Advanced Audit Configuration Settings Advanced Audit Configuration Settings -> Audit Policy -> Account Management -> Audit User Account Management In Servers GPO, modify the Audit Policy settings - enabling audit account management setting will generate events about account creation, deletion and so on. <http://blogs.technet.com/b/abizerh/archive/2010/05/27/tracing-down-user-and-computer-account-deletion-in-active-directory.aspx> <http://technet.microsoft.com/en-us/library/dd772623%28v=ws.10%29.aspx> [http://technet.microsoft.com/en-us/library/jj852202\(v=ws.10\).aspx](http://technet.microsoft.com/en-us/library/jj852202(v=ws.10).aspx) <http://www.petri.co.il/enable-advanced-audit-policy-configuration-windows-server.htm> <http://technet.microsoft.com/en-us/library/dd408940%28v=ws.10%29.aspx> http://technet.microsoft.com/en-us/library/dd408940%28v=ws.10%29.aspx#BKMK_step2
