NEW QUESTION: 1 You have two servers that run Windows Server 2008 R2 Enterprise. Both servers have the Failover Clustering feature installed. You configure the servers as a two-node cluster. The cluster nodes are named NODE1 and NODE2. You have an application named PrintService that includes a print spooler resource. You need to configure the cluster to automatically return the PrintService application to NODE1 after a failover. Which two actions should you perform? (Each correct answer presents part of the solution. Choose two.)
A. Enable the Allow Fallback and Immediate options for the PrintService application.
B. Disable the If restart is unsuccessful, failover all resources in this server or application option in the properties of the print spooler resource.
C. Move NODE1 to the top of the list of preferred owners for the PrintService application.
D. Set the Period (hours) option to 0 in the properties of the print spooler resource.
Answer: A, C
Explanation: Preferred nodes list defined If you define a complete preferred nodes list for a group (that is, one listing all the nodes in the cluster), then the Cluster service uses this defined list as its internal list. However, if you define a partial preferred nodes list for a group, then the Cluster service uses this defined list as its internal list and appends any other installed nodes not on the preferred list, ordered by their node IDs. For example, if you created a 5-node cluster (installing the nodes in the order Node1, Node2, Node3, Node4, and Node5) and defined Node3, Node4, and Node5 as preferred owners for the resource group, PRINTGR1, the Cluster service would maintain this ordered list for PRINTGR1: Node3, Node4, Node5, Node1, Node2. How the Cluster service uses this list depends on whether the resource group move is due to a resource/node failure or a manual move group request. Preferred lists and resource or node failures For resource group or node failures, the group fails over to the node next to the current owner on the preferred nodes list. In the example above, if the resource group PRINTGR1 on Node3 fails, then the Cluster service would fail that group over to the next node on the list, Node4. If you allow fallback for that group, then when Node3 comes up again, the Cluster service will fail back PRINTGR1 to that node.
